Will there be a Victrola in your home this Christmas?

The instrument that brings you the world's best music in

all its beauty.

The actual living voices of Caruso, Farrar, Gluck, McCormack, Melba, Schumann-Heink and other famous singers. The superb art of Elman, Kreisler, Paderewski and other noted instrumentalists. The brilliant music of Sousa's Band, Pryor's Band, Vessella's Band, Victor Herbert's Orchestra and other celebrated organizations. The inimitable witticisms of Harry Lauder, Nora Bayes, De Wolf Hopper, Raymond Hitchcock and other leading comedians.

Only the Victrola brings you all this wonderful variety of music—a delight every day in the year to every member of

your family.

Any Victor dealer in any city in the world will gladly demonstrate the Victrola and play any music you wish to hear.

\$15 \$25 \$40 \$50 \$75 \$100 \$150 \$200 \$300

Always use Victor Machines with Victor Records and Victor Needles — the combination. There is no other way to get the unequaled Victor tone,

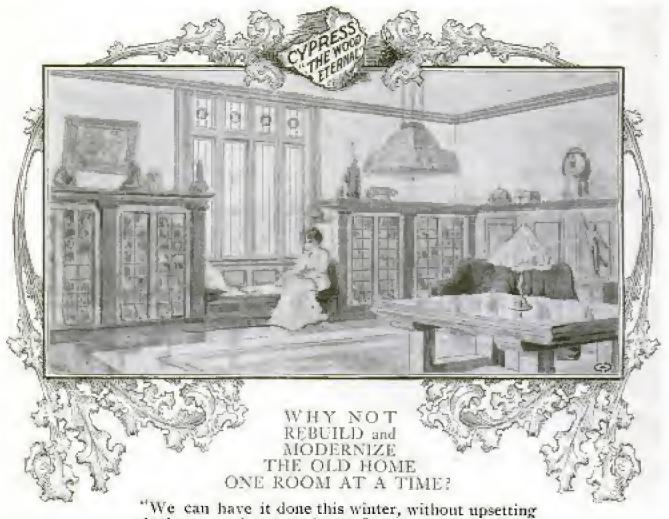

Victor Talking Machine Co. Camden, N. J., U. S. A.

XWYE-CF8-CELY

"We can have it done this winter, without upsetting the house, and perhaps in the Spring we can reshingle the roof with Cypress, 'the Wood Eternal,'" (You know it was only last year that historic Mount Vernon, Washington's old home, was reshingled with Cypress for the second time since its erection in 1743.) But to get back to the matter of New and Artistic Interiors, why not LET US HELP by sending you, with no charge or obligation at all, our booklet on

"New Insides for Old Homes"?

This is the title of VOL. 39 (VOLUME THIRTY-NINE) of the internationally famous Cypress Pocket Library, a series of authoritative text books on the Intelligent Use of Lumber, in which our particular product, Cypress, "the Wood Eternal," is recommended *ONLY* where it is the very best wood for the given use.

VOL. 39 contains 40 pages, with 10 pictures, an art supplement in tint (showing the beauty of Cypress grain), Detailed Working Drawings on a sheet 24 x 36 inches, with Full Specifications for rebuilding the Hall, Library, Dining Room and Living Room with architectural correctness and artistic finish without resort to expensive hardwoods. (Cypress works easily and is wonderful under stains.) Each design by an authority—on our special order. No "stock patterns." Write for Vol. 39. Study it. Use it.

When planning a Pergola, Manslon, Bungalow, pasture-tence or sleeping porch, remember — "With CFPRESS you BUILD BUT ONCES"

Let our "ALL-ROUND HELPS DE PARTMENT" help YOU. Our entire resources are at your service, with Reliable personal Counsel.

AVE you read about CATHERINE THE GREAT of Russia—the auburn-haired queen-the queen of romance? Was she the great queen-ardent lover-faithless wife-rumor has told? Was she twenty women in one - more beautiful than Helen of Troy - more brilliant than Cleopatra - more ruthless than Catherine de Medici - greater than Queen Elizabeth of England - this woman who came from a modest German duchy to rule over a wild Russian court and a wilder Russian land? What is the truth? The story of her life and every other character in history is to be found in the world-famous publication

h's History of the

Six Thousand Years of History

Ridpath takes you back to the dawn of History, long before the Pyramids of Egypt were built; down through the romantic troubled times of

Chalden's grandeur and Assyria's magnificence; of Babylonia's wealth and luxury; of Greek and Roman splendor; of Mohammedan culture and refinement to the dawn of yesterday. He covers every race, every nation, every time, and holds you spellbound by his wonderful eloquence.

The European War If you would know the underlying causes

which have led up to this conflict, the great racial antipathies, the connectial rivalries, the sting of past defeats, the vaulting ambitions for world empire, you will find them all in Ridpath's History of the World.

Ridpath's Graphic Style

Ridpath pictures the great historical events as though they were happening before your eyes; he carries you with him to see the battles of old; to meet kings and queens and warriors; to sit in the Roman Senate; to march against Saladin and his dark-skinned followers; to sail the southern seas with Drake; to circumnavigate the globe with Magellan. He combines absorbing interest with supreme reliability.

A complete list of contents would almost till they payed

Do you lack confidence in meeting other people? Are you conscious of Do you lack confidence in meeting other people? Are you conscious of another's personality and your own lack of it? Do you feel inferior to others? Are you superstitious about anything? Do you worry about your loved ones or about conditions? Are you afraid of approaching old age? Do you seem to be blinded by petty fears? Are you frightened in public? Are you afraid of your ability to "put things over"? Are you straid to assert yourself in your home or in business? Do you fear the courself of others? However, the course of supersonalities of others? However, the course of supersonalities of others? However, the course of supersonalities of others? opinion of others? Have you the courage of your convictions? no things that other men and women are doing seem impossible of accomplishment by you? Are you afraid to go in business for yourself or afraid to take the risks you used to? Are you able to brush aside all obstacles in order to arrive at your destination? Are you conscious of your power, self-confident and cager, demanding what you want, or do you stand cringing, hat in hand, and whine for it? If any of these subjects even touch on your condition, "Culture of Courage" will prove a godsend! opinion of others? Have you the courage of your convictions? Do things

Fear of self-fear of people-fear of the future-fear of things-fear for others (worry)-are what keep men and women down when they should and could be on top.

But not until the shackles are broken-not until fear is eliminated-not until courage is properly cultivated, can man come into his own.

culture of Courage"

by Frank Channing Haddock, Ph.D.

This great work by the famous author of "Power of Will"—a scientist whose came ranks with James, Ruyce, and Bergsen, is not an impirational book which userely admonishes you to "Destroy Your Fears" and "He Couragenus." Instead, it is a practical course in how to overcome each particular kind of human fear, physical as well as mental, to which we are all subjected. It contains actual principles, rules, methods, and exercises which any one can easily follow and become ten those hopping than you had even dared hope. had even dared hope

A Ghost-Scattering Searchlight

In "Culture of Courage" the author opens up into some of the most important emblems of existence; he throws a ghost-ceattering scarchlight into the shadows that have scarch people from rich fields of life; he team away the straw-and-goest-me entanglement which has held men and women in subjection; he pulls off the imagination-created masks of various lears, superstitions and hogstoos which he all ages have poralyzed the brain's energies and consumtly dinned into eager ears the failure slogans: "I'm afraid," "I dure not try," "I haven't the ability," etc.

As you study this your system, you will learn definitely be-

As you study this new system, you will learn definitely how Reason. Thought, Analysis, and Sanity can scatter to the high heavens the senseless visions of fear that are causing unatterable losses, embarrassments, and failures.

This book will startle you, will awaken strains of shought that may easily change the entire course of your career, just as it has that of thousands of other men and women in all walks of life who have learned its wonderful back-bone-building secrets.

Send No Money While published in book form. "Culture of Courage" is a comprehensive system of courage-building and contains more material than many \$25 correspondence courses. It has 14 main divisions, and fills 40 pages. Beautifully bound in half-leather, gold top leaves, big readable print—yet the price is only \$3,00, and we are offering it for five days' examination without a penny from you in advance.

Send no money—merely mail the coupon enclosing your business card or giving a reference. If, after you have it in your own home, you feel you can afford not to own this wonderful guide to a broader life, to things worth while, send it back. The examination will not have cost you a penny. Tear out, fill in and mail the coupon right now before you turn this, page, as this announcement may not appear in this magazine again.

Power Plant Engineering Steam, Electrical, Turbine and Refrigerating Engineering

Now the Most Used Engineers' Library in Existence—Because It Is Best

The power plant field is one in which the salary of the capable engineer depends entirely upon himself — his training. His responsibilities are increasing year by year — likewise his income. It is a field in which the demand for competent men is never fully met.

It is no longer possible for the engineer to climb to the higher places through the knowledge he gains through practice alone. He must study, but he must study standard literature only-books written from actual practice by practicing engineers.

The Power Plant Library covers every phase of power plant work, including a complete self-educating course in Mathematics, Engine Running, Valve Setting, Boilers, Pipes and Piping, Pumps, Shafting, Belting, Governors, Elec-tricity, Turbines, Refrigeration, etc.

If you are a power plant engineer or expect to become one, any one of the eight volumes in this set will be worth to you the small price we are asking for the entire library.

Nearly 3,000 pages of facts—facts for study or reference—facts for the beginner as well as the \$5000 per-year chief engineer. Nothing in power plant practice of today is omitted. Nothing is beyond your understanding. Upon receipt of coupon below we will send the set

weighing fourteen pounds, charges paid, for your inspec-tion. You do not obligate yourself in any way to purchase.

---FREE EXAMINATION COUPON---

McGraw-Hill Book Co., Inc., 239 W. 39th St., New York

Forster Sales Engineer of the General Electric Co., former General Manager of company manufacturing James Electric Motors; former Sales Engineer of Former Sales Engineer of the Co., now Consulting Engineer, also President and Director of the Wicks Electrical Institute.

This is the Age of Electrical Miracles! Electricity rules su-preme as the motive power of the world. It's wonders are the world. It's wonders are growing every day, on every nide of us, in every aspect of modern life and industry. It is opportunity! And still, as Thos. Edison says, the field of Elec-tricity is only in its infancy. The student of Electricity today will startle us with new marvels tomorrow. Right new we need men who know Electricity. There are not enough electrical workare not enough electrical work-ers to fill the big paying positions open. Every day the call for men grows more insistent. Feel-ing the pressure of this demand we are now making a very special offer to students at this time.

20 Lessons FREE Special Limited Offer

Never before has an offer so liberal been made on a Course in Electricity—probably will never be made again. I make it now because at the present time there is an unusual demand for trained Electricians and it is to my advantage to offer exceptional inducements to prospective atudents. I want to make it so easy for ambitious men that no possible excuse can be had for not accepting my wonderfully liberal offer. But this Free Lesson offer is limited, good for only 23 days. And there are only a limited number of these lessons to be given away free. So send the coupon at once. Let the free lessons themselves prove how easy it is for you to become an expert electrician by my methods.

I Will Teach You Personally

I will give you my personal and individual attention.

Makes no difference who you are, where you live or
what you do. I will train you by mail to become an Exnert Electrician capable of earning \$2,500 to \$4,000 a
year. My instruction is based on my own extensive,
penetical, everyday experience. I know just the kind
of training you need for the big money job. No needless
theory—no drudgery. You don't have to take a minute
from your regular work. Your spare moments will do.

Short Time—Small Cost

You will marved at the progress you will make under my instructions. Each lesson makes you more eagur for the next. And in an asterishingly short time you have masteried the entire course and become an Expert Electrician! The cost to you just now is so small as to be imagnificant. You can just the small tuition fee in payments so easy that you will searcely miss the names.

CARTOONS MAGAZINE

(Published by H. H. WINDSOR, Publisher of Popular Mechanics Magazine)

It is the only magazine in the field mobilizing the pen-and-ink satirists from the four corners of the world, men who are fighting silent battles on their drawing boards.

¶ So great has been the demand for back numbers of this periodical that several issues published early in the war have been exhausted. The file of Cartoons Magazine will be almost priceless a few years hence. It is a magazine for your library and reading table.

The picture of the man at the head of the table is that of a real flesh-and-blood man. Not so long ago he was only "one of the hands" of a big manufacturing company. He drew just so much pay, and no more. He never knew which payday would be the last. He didn't have special ability.

One day he marked the coupon of an American School advertisement, and now he's Assistant Chief Engineer of the same company—master of men—salary multiplied by four. The American School trained him for this important job at home, in his spare time. He didn't have to give up work or play—he wasn't obliged to exhaust his savings. Marking the coupon enabled him to make his mark in the occupation of his choice.

Multiply this man's case by thousands of others and you'll begin to understand how the American School can raise man salary—hatter more position.

American School can raise your salary-better your position

—ease your mind—no matter who you are, where you live, what you do, or what your age.

Mark the coupon and make your mark

The coupon in this advertisement brings eye-opening facts. Mark and mail it today! Doing this simple thing will

cost you nothing—will place you under no obligation. It will be the first step toward making your mark in the world,

Look over the list. Your chosen job is there. Whichever it is, just mark and mail the coupon. Then the American School will show you how easy it is to succeed—the same as the man in the picture.

Remember, no charge—no obligation—no agents. Mark and mail the coupon today-now!

erican School of Correspondence. Chicago, U.S.A.

"We have lost several times \$1000 on our freight charges since We MUST find a man to take his place." Smith left us.

Why not fill one of the 95,000 positions as Traffic Manager yourself? It's ly possible. We're talking facts now—not theories. There's no vivid imagination behind words. You can prove them before you answer this advertisement if you wish. easily possible. these words.

95,000 Trained Traffic Men Needed

Here's the proof. There are 500,000 shippers in the United States. 100,000 of them are big enough to employ individual Traffle Managers. There are now 3000 to 5000 Traffic Managers in the country. That leaves 95,000 shippers without a Traffic Manager to fill one of the most important positions in their entire organization; a man they need; a trained man who can save them money.

SALARIES:

\$1800 to \$4000 and Up

When you have mandered tariffe and forbit rates, you can lard he job, paying all the parties of the paying the parties will may then job of nearly, then you can earn as big b as \$10,000.

Interstate

Traffic School Dept. 172, Ft. Wayne, Ind.

GENTLEMEN: Send me abso-lately free and prepaid your new back on the Traffic Profession,

Unlimited Demand

Thousands of shippers are coming to realize their need of an expert, truined traffic man-ager. But the supply of trained men, who know all the ropes, doesn't begin to meet the demand.

Ask any shipper you know if the trained Traffic Manager isn't one of the most important and best paid men in the shipper's service. Ask him if it wouldn't be a good thing

for you to get into.

Prepare now to fill one of these splendid positions. Send for our free catalog. It tells who we are, what we teach and how we do it. We'll train you to earn \$1800 to \$4000 a year as a Traffic Manager.

Special Talent Unnecessary

Thousands upon thousands of men in America are in the wrong job, right perhaps, as far as the work is concerned, but wrong where the pay comes in. Few men can be contented in a job that doesn't pay well or offer a good chance for steady and cure advancement.

for steady and evice advancement.

This is the day when far sighted, ambitious men climb out of ruts and seek opportunities where the going is good.

To become a successful and highly paid Traffic Manager, just three things are essential. A common school education, intelligence and training. You don't need to have "special talent." It's a simple proposition. This isn't theore—it's facts—cold facts. theory—it's facts—cold facts.

The applications of electricity are increasing every day. The man who has an exact knowledge of electrical science has ever growing opportunity for profit. Ten years ago practically all machines in use were run by steam engine and countershaft, statistics now show that meet of the machines used are now operated by the electric drive. A generation ago gas was the only known means for lighting and cooking. Now almost every modern house is lighted by electricity, and electric clocking utensils are coming more and more in use. Even the steam locomotive, that great achievement of the twentieth century, is being gradually replaced by electric power. Whether it be for driving machines, for railway transportation, for lighting, for leading, for cooking, for a thousand daily necessities, the watchword of the age is "Do It Electrically."

Electrical knowledge means money to you and these books will show you how to get it. Hawkins Electrical Guides are the standard works on Electricity. They cover every single phase of the subject and they are written in a way you can understand. The text matter is arranged in questions and answers, and contains several thousand illustrations. No more groping for a solution of your electrical problem. You find the answer at once, clearly and concisely.

A Most Complete Library of Electricity

at the Lowest Cost

Look at the titles and convince Look at the titles and convince yourself that Hawkins Electrical Guides tell you exerything you want to know in Electricity. They are a coincide course in Electrical engineering, written especially for the ambitious man who is training himself for advancement, for the wide awake man who is likely to be called in for work outside of his regular line, for the men who needs at his elbow. For ready reference, an accurate up-to-date work on electricity. An examination of these brokes will convince you of their value instantly. They cost \$1 per volume. They are a wonderful buy at this price, and they are the least electrical books at any price. Don't take our word for their mories. Power of Will Makes Dreams Come True

Send No Money — Examine Book Free

Will Power, properly cultivated and directed, is the driving force behind your brain that turns empty air castles into happy realities. No man since the world began has ever achieved anything worth while without an inflexible will.

What do you want most in life? Money and all that goes with it? Reputation, Prestige, Power? Greatermental and spiritual happiness? Botter acid-control? More confidence in yourself? Whatever you want—whatever you have dreamed about some day having—can be yours. If you will only train your will as thousands of others have done with unfailing result.

Your Will Needs Practice

If you should stop work for two years and have no occasion to use your brain in solving business problems, you would credually become unable to use it as you do now, simply from lack of practice. It's continual practice that makes it pessible for you to arrive at quick decision and onables you to easthe solution of vexing problems quickly, and you'd be surprised how soon the gift would have you were you to get out of the harmess for a few years. The same is true of the Will. Because we don't use it, we don't know how. Most of us float along carrying out other people's wills simply because out one will have become sepached and dormant from lack of use. You the Will is just as susceptible to training as the brain or memory and by the very same methods, by intelligent exercise and use.

by Frank Chaening Haddock Ph.D., a scientist whose name ranks with such leadered thought as dames, Bergson and Royes—is the first thorough course in Will training ever conceived. It is based an a most perfound enalysis of the Will in human beings. Yet every step in the 28 fascinating lessons is written so simply that sayone can understand them and apply the principles, methods and rules set down with noticeable results almost from the very start.

May Transform Your Life

The neers of "Power of Will" have experienced results through its sindy which beyier on the mirrorlens—it has enabled thousands to win out with tag plans which they not weaked on unsuccessfully for years—it has made notice men of affairs out of pitiable down and outs—it has made notice men of affairs out of pitiable down and outs—it has readormed those who had always been the nown of others into self-confident powerful leaders—it has enabled women held down by perty fears—by trivial dutily incidents—to brush them aside as though made of papier-mache—by teaches self-mastery—control of apportion and destress and it has enabled strong, successful men by the thousand to accomplish toger though by giving them even greater reaver to use in their dealings with culters.

No natter what your ecouption is life—no matter what your greater to will "an help you by giving you he power to become the dominant factor in your every undertaking—in enabling your omake those with whom you come hacastat work its year each, have also you to so control your const hand what is equally important, it teaches you to so control your can actions that you conscious that your constitution is sent to the conscious trust as each of the place. It invariable makes decrease come trust as error 73,000 men and women newers of "Power of Will" castell you.

MEN WANTED To DRIVE and REPAIR Automobiles and Tractors

The Sweeney Automobile School

equips you with a splendid paying trade in six weeks-hundreds of good jobs open to young men mechanically inclined. My big illustrated book fully explains the opportunities open to you as a mechanic, chauffeur, repair man, salesman, garage owner, etc.

Tear Off and Mail the Coupon Herewith Today-Right Now

It may mean to you all the difference between success and failure. Will you, by training yourself in a few short weeks, become a competent, expert automobile man? Cash in on your time. How would you like to have an carning capacity of \$5 a day and up? How would you like to have a trade that will always insure you good wages, independence, opportunity to see the world? How would you like to be in demand? Have employers looking for you — have big opportunities for a successful career spread out before you? Now young man, you can't do this simply by wishing. You have to take action. This Automobile School has over 2000 successful graduates. Practically all came here without the slightest experience. But all had ambition and resolution. If you have these qualities you can be sure of success. The first step is to send the coupon and get the big free book. It obligates you in no manner — binds you to nothing. But it gives you without cost or trouble all the facts you should know. Learn how others have made good. A post card or coupon brings this book today.

The Sweeney System of Practical Auto Instruction

is now universally recognized as a most thorough, practical and interesting course of automobile instruction, leading to certain and profitable EMPLOYMENT. It embraces every point worth knowing, including vulcanizing, brazing, oxyacetylene welding, lathe work, machine shop practice, testing, driving, truck repairing and operating, etc. AND YOU LEARN by doing the work on REAL CARS under the watchful

Make \$5 Per Day and Up

21,000 tractors were sold this year. Over half a million automobiles. Who's going to drive and repair them? Men are in big demand. Our school is doing double the business it did last year. Nothing succeeds like success. Don't you want to make \$5 a day and up? There's money in the automobile business for you. Read this letter from one of our boys. We have hundreds like it.

one of our boys. We have hundreds like it.

Hollis Motor Company, Delphes, Konsas Oct. 12, 1915.

Dear Sweeney:— I left your school two rears up this month, and have been making some real motory since then. Was out of school about a week when I landed u job at \$20.00 per week to start; the past year my brother and I have been selling Maxwells in Hush county as per letterhead.

Now I can recommend your school to anyone that wants to get in a business where they can make real money all of the time. Also you can use this letter in any way you see fit.

Yours truly,

S. F. HOLLIS.

Experience Is the Best Teacher
This is the only way to learn. Do things with your own hands. Practice beats theory. We do not merely tell you how; we show you how, and you then do the work yourself. We have over 40 cars of all makes on our floor, eight trucks, five tractors, and our DRIVING TEACHERS keep out on the road nearly twelve hours a day. YOU GET PLENTY of WORK of all sorts.

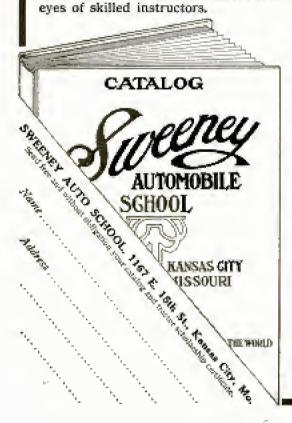

No Books Used; Tools Furnished Free

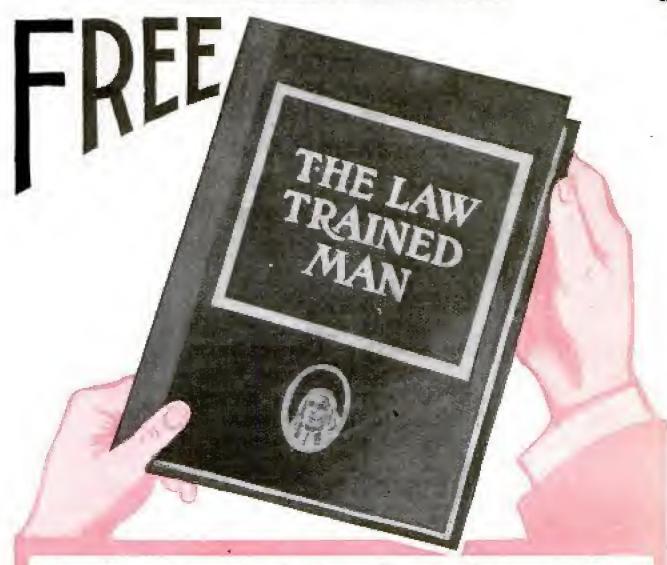

The tuition is low and after you have paid that there are NO MORE expenses or extras you have to boy. If you could learn from a book there are lots published you could read at home, but practical work is the only method, and this is what makes my School so successful.

This Big Book Costs Me 50 Cents BUT I SEND IT FREE

If you are interested in planning your future and mean to investigate the opportunities before you. I will gladly send you my automobile book. This book is almost like a visit as it has 123 illustrations showing men at work in every department. It pictures the wonderful equipment of the Sweeney School. It shows how you are taught, shows the class of men you will associate with, portrays various phases of the automobile industry, explains how, when and where you begin to earn money, in a word is a complete encyclopedia of the subject. Simply send name and address today.

This Inspiring Book Free To Ambitious Men

This intensely interesting and instructive 165-page book tells you how a knowledge of law has proved to be the stepping stone for thousands of men to larger incomes and to power and achievement.

It tells you of the great and increasing demand for lawyers and how you can become one. It tells you why law trained men are now selected for most positions of

igny trained men are now selected for most positions of responsibility in business, public life and social work—and how you can grasp these opportunities.

It shows you have you east become fund trained without leaving your home or dusiness by a method which includes the comprehensive features of the best resident low calculations in a nedwined by distinguished men throughout the country in whose opinion you have the street confidence. Send for your copy of "The Law Trained Man," today,

Modern American Law Course and Service of Blackstone Institute

Blackstone lastitute (including The Sprague Correspondence School of Law) was founded in 1990, and is by far the cidest and largest law school for non-resident instruction in the world.

We have successfully trained more than thirty thousand men and woman in law. Among our graduates are the Governor of a State, United States Sanators and Congressmen, State, County and City Officials, many Judges and thousands of successful Lawyers and business men everywhere, This notable record extending over twenty-five years is the most convicting evidence that we produce results—and it is invalid that count.

Address, Extension Division 1359

Chief Justice Ladd of the Supreme Court of lows, says;
"Every person interested in the law will receive from Black-stone Instructions on uncamily seculent—in fact, the deal, may resident system of instruction."

president system of instruction."

The Course has been prepared expensivily for home study by eighty eminent judges and law writers. It is clearly writern in simple, non-technical inagunage. It is precised, yet reads like an interesting steey. Frediminary education is not necessary. You can read in appreximes at home, and you will tense fit from the day you start. Our Course and Service will prepare you on all subjects required in the law examinations, as it has already done for thousinds of others in goir own state, and every other state in the Union. It will equip you to become a lender in business or public life—and to attain positions of bonor and profit open only to law trained men.

Special Offer—Investigate Free

The recent union of The Sprague Correspondence School of Law with Black-stone Institute and the resulting increase in ear facilities, condict the make you a most important Special Office. Perfect Your Memory and You Can Command What Salary You Will

Your salary—what it is today—what it will be tomorrow-depends very much on your memory. Tricky memories—wandering minds—unable to grasp detail-have thwarted thousands in their battle for success—have held them down to bare living wages-working long hours with slight prospect of advancement - subordinates for life.

The Ability to Concentrate, to Think and Express Yourself Clearly Means Every-thing to Your Success

America's men of power - in business, social or public life-are uniformly men of trained memories. Train your memory properly and you will find yourself able to concentrate absolutely on matters at hand-to think and speak connectedly—to develop self control, to over-come self consciousness—to make your PERSON-ALITY DOMINATE. Think what this means —a better position—bigger pay—social and business success—the EFFICIENT LIFE.

Give Me 10 Minutes a Day and I Will Give You a "Steel Trap" Memory

That is all I ask—just ten minutes a day for a few weeks and I will train your memory just as I have trained the memories of 50,000 others. I will make your mind an infallible classified index from which you can instantly select facts, figures, faces, arguments. No matter what your ageyour education — your vocation — your place of residence — I can make you "forget proof"—can train your memory for SUCCESS.

SPECIAL OFFER!

The Truth About Poultry

Reading The

Successful Methods of Men on Farms or Small Acreage. Complete in twelve parts; printed in one volume.

By DR. N. W. SANBORN

REAL work, with real poultry, on a real New England Farm. This is a simple story of what has been done by a man, at forty-five years of age, town bred and city educated, getting out of practice of medicine, buying a small farm in the hill country, and making a success of the venture. Not only is the rearing of chicks and the management of adult fowl completely covered, but the interesting side issues of fruit growing, grain raising and the production of milk, that cannot be escaped on a real farm. You get rugged facts—rarely found in print. The truth about poultry as found in actual life on a one-man poultry farm.

You Can Do the Same, Book Tells How

OUR SPECIAL OFFER—The One-Man Poul-try Plant, in twelve parts (book form), and the American Poultry Advocate, one year, for only 50 cts., book and Advocate, three years, for only \$1.00, if order is sent at once.

Our paper is bandsomely illustrated, practical, pracressive and up-to-date on poultry matters. Established 1892, 44 to 192 pages monthly. 50 cents a year. 3 months trial 10 cents. Sample copy tree, Catalogue of poultry literature free. Meen

Don't Be a Draftsman!

Learn these facts before you enroll for any Drafting Course

Are you planning to learn Drafting? Have promises of light, pleasant work at a big salary tempted you to become a Draftsman? THEN YOU OWE IT TO YOURSELF TO KNOW THE FACTS BEFORE ENROLLING FOR ANY DRAFTING COURSE!

Drafting alone will never get you anywhere! You can't earn more than a decent living as a mere Draftsman. The big money goes to the man who tells you what to draw—the Architectural, Structural, Mechanical or Civil Engineer.

Drafting Only a Beginning

All Engineers are expert Draftsmen. Drafting was the first thing they learned. But they weren't satisfied to spend their lives drawing other men's plans. They didn't stop when they learned Drafting—they went right ahead and got the special training that enables them to hold down big jobs and draw big pay. YOU, TOO, CAN GET THIS TRAINING, and it will cost you only a little more than a course in Drafting alone

Be an Engineer—Earn \$2500 to \$5000 a Year! We will train you -in

Be an Engineer—Earn \$2500 to \$5000 a Year! We will train you in earn \$2500 to \$5000 a year as an expert Engineer. First of all we will teach you Drafting, furnishing a \$20 Drafting Outfit and a \$20 Drafting Library (4 Vols.) ABSOLUTELY FREE! Then, after you have mastered Drafting and are getting setting which are preference in an Engineer's reflect, we will train you in you have mastered Drafting Mechanical and Civil Engineering. Why stop at a Draftsman's pay when a little more study will make you an Engineer, competent to fall a masterishie, well-use ing position?

This is the big advantage which the American School offers. A staff of highly-trained instructors—men who have been graduated from the country's greatest technical excepts—emblies as to present you in any branch of Engineering you selved. Remember, we train you—in your spare time—to become a high-salacied Engineer, not an ordinary Draftsman. It will cost you only a triffe more than a course to Drafting alone, and you can you for your instructions as you progress—in small monthly installments.

Don't servel for any Drafting Course will you have thoroughly investigated this remarkable offer. The course will bring you fall particulars of your Engineering Offer and a copy your 200-page Free Book. I am interested in a course of Drafting Instruments and the free four-volume Drafting Library.

Which Book Shall We Send?

If you're a mechanic How to Make the Farm Pay or clerk, a sal-More aried, business or professional man, who wants to get out of the "rut" and enjoy the freedom, independence, healthfulness and prosperity of a successful farming business and give your children a real chance in life by bringing them up in the ideal environment of the country—then our book, "Modern Farming—the Salaried Man's Opportunity" is the one you went.

Man's Opportunity" is the one you want. It will show you how to apply your city business training to the farming business to make it pay—how to sidestep the long, wearisome.costly experience route in farming, how to make the short cut to success, how and why you can study proven scientific farming methods at home, by mail, during your spare time, under the personal guidance of agricultural college. It also tells you how you can make a start toward an independent farming business of your own by getting a good salaried position in of your own by getting a good salaried position in agricultural work, or starting a poultry, truck, fruit, ginseng, mushroom or flower garden for profit as a sideline to your present work.

If you're a farmer, our book, "How to Make the Farm Pay More" will dreamed of possibilities that exist right on your own farm; will show you how A. F. S. courses have enabled hundreds of farmers to increase and improve their crops and to enlarge their incomes.

ST. HELENA TRAINING STATION INFANTRY BRILL.

The Value of Navy Training

If The training a young man receives in the U.S. Navy will be of the greatest help to him in his later career. At the Navy Training Stations, where all apprentice seamen go, the recruit receives a practical course of instruction for a period of six months before being assigned to sea duty. The drills are interesting, the life is healthy and invigorating, and the work is not arduous.

¶ There is plenty of time for play, and plenty of recreation, boxing, baseball, track athletics, swimming, rowing, sailing, and "movie" exhibits.

■ Besides seamanship, many trades are taught in the Navy. The man-o'war of today needs skilled artisaus, and the Navy trains its men to fill these jobs. ■ The sea has always possessed a fascination for adventurous young men, and this fascination has nowise lessened by the modern equipment of the dreadnaught, with her powerful radio, her excellent messing -arrangements, her shower-baths, her steam laundries, and countless other improvements for the comfort of the enlisted men.

You'll be interested in knowing more about the Navy. Recruiting stations are located in nearly all the cities. Look up the address in the want columns of the daily papers, visit the nearest office, and have a talk with the men there. Or write to—Box 65

Good Horsemanship Shown in Odd Hurdling Event 657# Hurdling Event

URING the course of a fashionable horse show recently held at an eastern city, the spectators were surprised by the introduction of a strikingly unusual hurdling event. It was a distinct innovation and a contest fraught with tenseness, both for the onlookers and riders.

A long, rectangular table, painted white, spread with linen and set with china and glassware, as if for a formal dinner, was placed on the far side of a hurdle. The position of the table made it difficult for the horses to see the additional obstruction until they were in the act of leaping. It was so placed that it was also necessary for them to take both the hurdle and table at the same time.

There were six entries in the event. The rules provided for the award of a prize to the trio which should simultaneously take the hurdle and table at one jump without upsetting any of its dishes or decorations. The requirement that each group negotiate the hurdle at the same time obviously imposed an additional handicap for the horses and huntsmen alike. Either a slight tendency to drag the hind feet, or a premature forward movement of the limbs for recovery, by any one of the animals would undoubtedly end in a mishap and the disqualification of the trio. This is precisely what oc-curred in one instance. The other group hurdled cleanly and captured the honors.

Winning Trip of Horses Taking Hurdle and Dining Table Simultaneously during Unusual Contest

POPULAR MECHANICS

CYCLING CLUB USES ROAD MARKER

508 mc

A sticker on which is a diagram representing every possible crossing, fork, or turn in the road is being used

by a cycling club in St. Louis, and is proving of the greatest value in connection with club tours over unfamiliar roads. These stickers are posted in a conspicuous place at the intersections by some one in the leading division familiar with the road, who marks the figure with the route taken, the names of those comprising the division, and the time when the division passed. In this way, those following lose no time in inquiring the road, and are able to determine whether or not it is possible to overtake the division preceding them.

DETROIT GETS GOVERNMENT FOREIGN-TRADE OFFICE

The fourth branch office of the United States Bureau of Foreign and Domestic Commerce is shortly to be established in Detroit, through the efforts of that city's board of commerce. The three other cities having a similar foreign-trade bureau are Cleveland, Cincinnati, and Los Angeles. The Great Lakes states will therefore have three out of the four existing bureaus.

LIFE-SAVING APPARATUS FOR LOCOMOTIVE CREW

In an attempt to provide a means of safeguarding locomotive engineers and firemen against serious injury and death in railway accidents, a southern inventor has developed a mechanical apparatus which has elements of novelty and interest, even though the practicability of all its features may be

contested in some degree.

Under the usual conditions the members of an engine's crew are afforded two alternatives when a collision is seen to be inevitable. They may jump, and probably be killed in so doing, or they may stick with the locomotive and take their chances. Providing the new appliance works as it is intended to do. the life of an engineman, in such an instance, depends upon a brief warning of impending danger. Not infrequently a wreck occurs entirely without warning, and in such a case the present invention is worthless. Given ten seconds, or possibly even less, in which to act, however, and the safety apparatus seemingly affords a good opportunity for an engineer and fireman to save themselves.

Primarily the contrivance consists of two large steel cylinders mounted in a frame attached beneath and at the sides of an engine cab, immediately under the seats. The cylinders are made of boiler plate reinforced on the inside with a series of channel irons that enable it to withstand a crushing force of as much as 500 tons. By pulling a lever, the seat upon which an operator is sitting is released. This drops him, seat and all, into the cylinder, which is then closed mechanically and thrown free from the train.

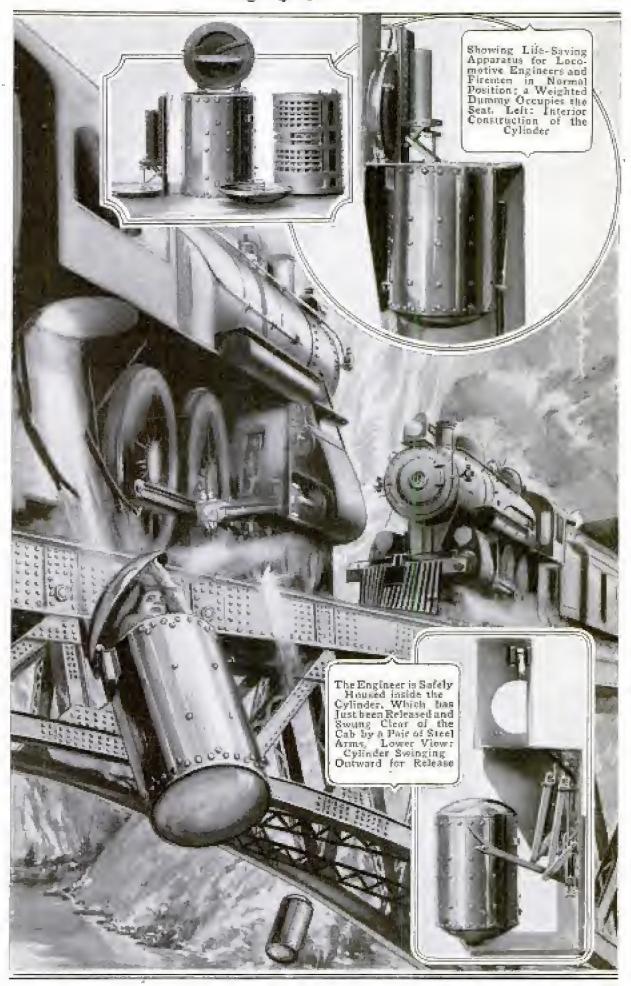

The interior of the tank is lined with coil springs heavily upholstered with pneumatic cushions. This prevents the injury of the occupant, so far as shocks, bruises, and the possibility of laceration are concerned. In addition there is a thick lining of asbestos insulating the compartment against fire and heat.

If a heavy locomotive should fall on one of the cylinders, the impact would

9-29-15

Inventor: W.a. Utz 2109 Jennings av. H. Worth, Elycae

not be sufficient to crush it. Neither could escaping steam, boiling water, nor hot coals from the fire box penetrate it. Should a wreck occur on a trestle over water, or a train go through an open bridge, the occupant would not be drowned, for the cylinder will float and sustain a burden of 600 lb., according to the inventor's claims. Asphyxiation is guarded against by air valves which may be operated from the inside. There is also an oxygen tank for use in the event that submersion makes the valves incapable of ac-Space is provided for carrying an electric flash light, a life belt, and an emergency medicine chest. device may be opened from either the inside or exterior.

SHROUD EVERGREEN TREES
TO PROTECT FROM SUN

The park superintendent of a southwestern city undertook a short time

Recently Transplanted Evergreen Trees were Covered with Hoods as a Protection against the Hot Southwestern Sun

Besides offering an engine crew an avenue of escape, the apparatus performs the duties of both the engineer and fireman after they have abandoned a locomotive. In this way the welfare of passengers aboard a train is looked after. When, in order to save his life, an engineer draws back the lever that drops him into the cylinder, the action simultaneously throttles the engine, applies sand to the rails, sets the air brakes, dumps the fire, and pours extinguishing agents upon it.

The cylinders vary in size. One type is 5 ft, in height, has a diameter of 36 in., and weighs approximately 2,000 lb. The equipment, which includes two of these devices for each engine, costs between \$500 and \$600.

ago to transplant several large evergreen trees. The trees did very well for a while, but the hot September sun seemed to be too much for their impaired vitality, and a general wilting resulted. In an effort to tide the trees over to the cooler weather later on, the superintendent had large portable hoods, or shields, made, which he placed bodily over the trees. These have proven a success, and the trees will be able to hold out until the winter rains come and give them a firm hold on life.

CORD LAYERS AID TIRE TO WITHSTAND HARD USAGE

A single-tube bicycle tire has lately appeared on the market which the manufacturer claims to be of especially durable nature, due to its being built up of corded layers. The inner tube of black rubber is surrounded with a spiral winding of cotton cord, over which a second layer of rubber is placed, covered with another spiral winding. Over the outside a thick layer of white rubber is molded, forming the tread. Such construction is claimed to possess greater resiliency and strength than tires built up of cloth layers.

WIRELESS MAST IS WRECKED BY HEAVY WIND

On the day following its formal dedication, a 300-ft, wireless tower under construction at Tufts College, Mass., was completely wrecked during a severe windstorm. The upper section of the steel mast was inadequately steadied by temporary guy wires which snapped on the windward side during a 38-mile gale that blew the structure across an adjacent railway track in front of a speeding express train. The locomotive was derailed, but without serious results.

The tower was 3½ ft. square and was built of 3 by 3 by ¼-in, angle-iron uprights having horizontal and diagonal bracing members, the former spaced 4 ft. apart in the vertical. There were to be three sets of permanent guys, each consisting of three cables held by concrete anchors set 120° apart and about 150 ft. from the base. These wires were to be secured to the mast at intervals of 100 ft. The lower sets, which were already in place, had a diameter of ½ in., while the top

ones were to have been ¾ in. in cross section.

Although it was torn from the ground, a reinforced-concrete base on which the mast was anchored was not injured. This block is 5½ ft. square and 1 ft. thick and remained firmly fastened to the steelwork. In falling, the tower twisted somewhat, but did not buckle.

An interesting feature in connection with the dedication of the mast was a scaling race indulged in by three structural ironworkers. Each competed in climbing the framework and fastening a flag at the top. The first to reach the ground after accomplishing this feat was declared the winner.

The reconstruction of the mast will be commenced immediately. It is believed that about a third of the steel in the wrecked structure can be used in this work. When completed, the plant will have a sufficient radius to permit an interchange of messages with European stations. The mast will hold an antenna of the umbrella type and it is planned ultimately to carry it to a height of about 500 feet.

РИОТО ВЕ СИССАЗО ИЗВАКО

708 CHICAGO'S MUNICIPAL PIER NEARING

BY the time that navigation is opened on the Great Lakes next spring. Chicago's new municipal pier, designed for steamship and recreation purposes, will be ready for use. The completion of this work will mark an important step in carrying out the city's plan for a comprehensive outer harbor. The pier, also, will be the longest municipally owned one in this country and will represent an expenditure of approximately \$4,000,000.

It is situated a short distance north of the mouth of the Chicago River and extends 3,000 ft. into Lake Michigan, The approach on the shore side includes 21 acres of filled land, which will eventually be used for commercial

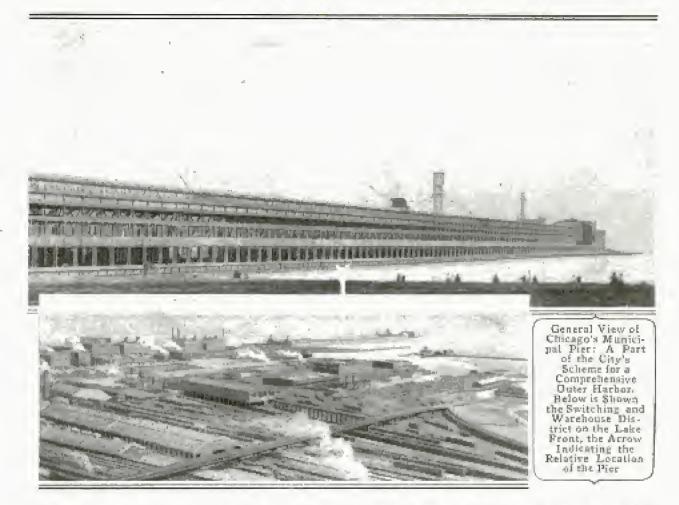

purposes.

The pier has a width of 292 it., and carries, at the rear of a large head house, which serves both as an entrance and administration building, two parallel, double-decked sheds, each 2,335 it. in length. These long structures are separated by a central driveway that is flanked on either side by railway tracks. At the extreme end of the pier a space, 665 ft. long, is reserved for recreation purposes. All freight will be handled on the lower level, while the second deck of each shed will be used for the accommodation of pas-

senger traffic. By this arrangement freight may be unloaded onto the docks and taken through the sheds to cars on the same level in the areaway. Likewise passengers will be discharged from the main decks of steamers onto the upper level and into street cars on the court side,

Steel and concrete have been used throughout in the construction work. The head house is faced with brick, the sheds are inclosed in glass set in steel sashes, and roofed with reinforced-concrete slabs covered with a composition surfacing material; the freight houses paved with wood blocks, and the passenger sheds finished with cement floors. Broad, winding concrete ramps replace stairways in the head house. At either side of this three-story building is a massive, octagonal tower, housing a steel tank of 60,000 gal. capacity, which is connected with the freight-house sprinkling system. Extending along the water side on the top the entire length of each shed, is an 8-ft. board walk. terminating on the roof of the recreation pavillon. This provides a delightful promenade more than a mile in length.

The recreation building at the far end of the pier will be used purely for

pleasure purposes. One of its principal features is a hall, 140 by 140 ft., which will be open to the public for dancing and other entertainments. There is also a large concert stand, and the design of this gives the end of the building a semicircular form. A generous open space surrounds the structure and is concreted and terraced. This will give access to the extreme end of the pier, where small pleasure boats will dock, and will be provided with comfortable seats and benches. In the terminal building, joining the two sheds immediately back of the recreation building, will be a restaurant with accommodations for several hundred persons. An emergency hospital and large concourse are also provided in this structure. Two ornamental towers, each 100 it. in height, will grace the end of the pier.

The massive structure is carried on a pile foundation independent of the fill. In a period of nine months, approximately 17,000 piles were driven, 1,000,000 cu. yd. of earth filled, and $1\frac{1}{4}$ miles of concrete dock constructed. The greater part of the work has been completed.

LARGE COASTWISE STEAMERS

Announcement has been made that the steamships "Kroonland" and "Finland," engaged in passenger and freight service between New York and San -Francisco, via the Canal, are to be equipped with low-pressure, fuel-oil burning systems. This is to be done in order to increase the speed and efficiency of the vessels as well as to reduce the cost of their operation. Each is 580 ft. in length and has a 22,000-ton displacement. When the installations have been made, these vessels, it is claimed, will be the largest merchant ships thus equipped. It is estimated that by burning oil, the fuel cost will be cut 40 per cent, and the fire-room staffs perhaps 80 per cent.

BUILDING QUEBEC BRIDGE G G A COLOSSAL TASK

N its general dimensions as well as I in the enormous size and weight of the structural members composing it. the Quebec bridge, now in an advanced stage of construction, surpasses any other structure of the kind ever erected. The one bridge structure in the world that approaches it in magnitude is the famous Firth of Forth bridge in Scotland, the main-channel span of which is nearly 100 feet shorter than that of the Quebec bridge. Both structures are of the cautilever type. The channel span of the Quebec bridge, measnred between centers of towers, is 1,800 ft. The design and fabrication of the steel for the structure therefore presented engineering problems for which no precedents existed, and the first attempt to build the bridge, made by a private company, resulted in 1907. in a collapse of the structure in which many lives were lost. Following that catastrophe, the Dominion government

took over the work, and a year later undertook the construction of the bridge. The present bridge is on the same site as the original structure, but owing to an increase of 21 ft. in the width between trusses and to a considerable increase in the weight of the superstructure, new piers were necessary and these were built immediately south of, and adjacent to, the original piers. The two main piers alone contain approximately 60,000 cubic yards of masonry, and cost in the neighborhood of \$1,500,000. One of these piers goes to a depth of 60 it, below the bed of the river, and the other to a depth of 80 feet.

Owing to the fact that the principal members of the bridge were larger than any ever before made, it was necessary to erect a special plant for the fabrication of the steelwork. This plant was installed at a cost of about \$1,000,000 and is equipped with the

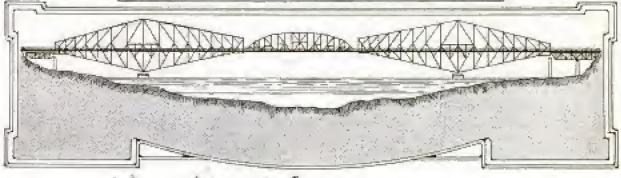

4. P. Borden 709 new Birke Bldg.

In This Photograph are Shown Ten Truss Members Where They Come Together over One of the Main Piers. Their Enormous Size can be Appreciated by Comparison with the Man Shown in the Picture; the Size! Shoe on Which These Members Rest Weighs 400 Tons and was Made and Shipped in Seven Sections. The Bridge as It will Look When Completed in Shown in the Picture Below

Marietown Shipstriedding > Dry. Book le

heaviest of cranes and machinery. Every precaution was taken in the manufacture of the different parts of the bridge, and all field splices and connections were drilled to fit accurately before being shipped to the site. An idea of the task confronting the designers and builders of the bridge is given by the dimensions and weights of some of the principal members. The posts that spring from the main piers and form the central feature of the gigantic cantilever structures are each 310 ft, high and 10 ft, square at the The making and erecting of these four posts cost nearly \$1,000,000. The bottom chords of the bridge adjacent to the main piers are approximately 86 feet apart, and are 7 ft. high and 10 ft. wide. The weight of one section of the bottom chord is about 400 tons. Owing to its size and weight, it was necessary to make and ship each section in four pieces and then assemble and connect the pieces in place. The longest tension member shipped is 137 ft. in length.' Each of the shoes for supporting the structure on the main piers is 21 by 26 ft. at the base, 19 ft. high, and weighs 400 tons. The shoes-were each made and shipped in seven sections. Pins 30 in. in diameter, with 45-in, bushings, are required for connecting the bottom chords and main posts with the shoes, while pins

15 and 16 in, in diameter are used in the top chord.

In the erection of the bridge the anchor arms, which lie between the main piers and the shore, were constructed on steel falsework, while the cantilever arms are being built out over the river without falsework, by the cantilever method. The 640-ft. suspended truss to connect the cantilever arms will be built on shore, floated into position on pontoons, and then raised by powerful jacks and connected with the cantilevers. For the erection of the heavy bridge members two traveling cranes, one working on each side of the river, are used. Each traveler weighs about 1,000 tons and is equipped with two boisting machines each capable of lifting 100 tons. The principal feature of the travelers is a tower that stands 200 ft. above the floor of the bridge. Supported on top of the tower are cranes through which the lifting lines are worked. All the machinery on the travelers is electrically operated. To avoid bringing uneven stresses on the partly completed structure, similar members on the two sides of the bridge are lifted by the cranes and erected simultaneously. The total length of the bridge between abutments is 3,239 ft. As now planned, it should be possible for trains to cross the bridge by the end of the year 1916.

OCEAN-SURVEY SHIP BUILT AT

It is unusual, perhaps, for a boat-building firm on inland waters to figure much in construction of ships for deep-sea use. Yet a concern at a Lake Michigan port recently secured a contract to build an ocean-going vessel, which, curiously enough, is not to operate on the Atlantic, the nearest ocean, but far over on the Pacific coast in Alaskan waters. The government desires the boat for coast and geodetic-survey work, and it is to be built strong enough and will carry sufficient stores to cruise three months, or more, at a time through all kinds of weather.

The dangerous waters of the Bering Sea are to be charted with the new craft. The vessel is to be named the "Surveyor," and will be made of steel with 1,000 tons displacement. Crude oil is to be used as fuel, and the engines will be of the triple-expansion type. A crew of 66 officers and men are required to operate the boat.

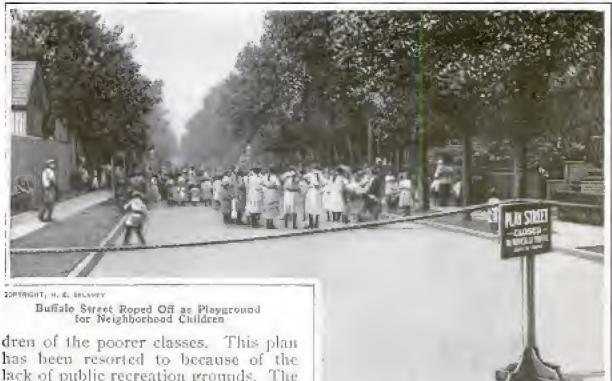

CITY STREETS ARE CLOSED SO

In the congested tenement and foreign districts of some of our large cities, certain streets are being roped off for a few hours each afternoon to provide safe playgrounds for the chil-

#. E. Delaney, 35 Garner ave.

Bulde, r.y.

dren of the poorer classes. This plan has been resorted to because of the lack of public recreation grounds. The closing of one or two blocks of thoroughfare in a neighborhood does not materially interfere with vehicular traffic, while it does give hundreds of youngsters an opportunity to exercise themselves without danger of being struck by motor cars and trucks. At Buffalo sections of some of the streets are closed from three to six o'clock each afternoon, during which time children from the surrounding neighborhood are allowed to play under the care of a director.

SMALL ELECTRIC PROJECTOR

As an accessory for motor cars, a small electric searchlight has been introduced which may be attached to a windshield and used for illuminating turns in a road, or house numbers from a distance. It is tubular in shape, 6 in in length, and has a diameter of 2½ in. By employing a projecting lens in conjunction with a focusing lens, the necessity of a reflector has been eliminated. Current is supplied either by the regular lighting circuit or a 6 or 7-volt storage battery. The compact housing, and the fact that the lamp may be removed readily from its sup-

porting bracket, makes it convenient when engine or tire trouble develops on the road at night. The lamp is so mounted that it may be turned in any

A Compact Auxiliary Searchlight of Very Small Diameter Designed as Aid to Motorist

direction by a driver when he requires an auxiliary light. Since it is detachable, it may be carried in a tool box during the daytime.

THEATER CHAIR DESIGNED 57 TO FIT NEEDS OF CHILD

For the benefit of the children patrons of motion-picture houses, an ad-

justable theater chair has been invented which may be converted to suit the requirements of either an adult or

a child. The front two-thirds of the seat is attached to a pair of arms which are hinged to the forward ends of the regular supporting members. This permits the fore part of the seat to be raised to the proper position for a child, where it automatically locks. In its normal position the seat is 17 in. from the floor, but when adjusted for a small child it is 24 in, high. As the seat is raised a wooden bar, intended as a foot rest, moves into position simultaneously. By the installation of a chair of this type, a child does not need to sit on the arm in order to get an unobstructed view of the screen.

POWER FROM GAS ENGINE IS LESSENED BY ALTITUDE Dates

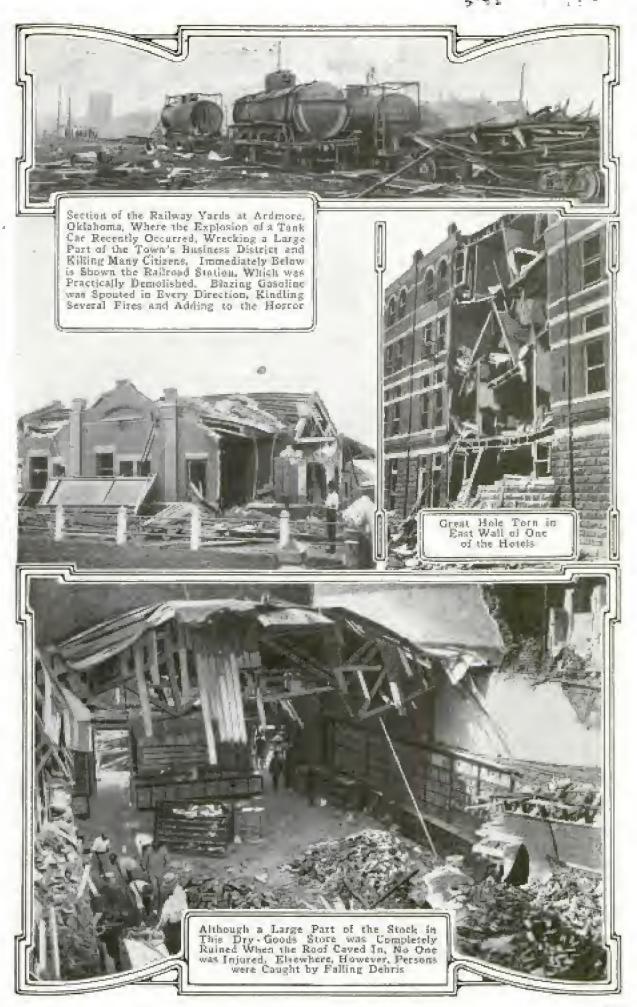

The curious fact has been demonstrated that high altitudes apparently have a marked effect on the power obtainable from a gas engine. Recently one was erected several thousand feet above the sea level, but upon testing, failed to give the desired power. An investigation followed, and the loss in power was attributed to the height at which the engine was operating. The general conclusion was reached that a gas engine loses about one per cent of its indicated horse-power per 1,000 feet of elevation.

7 45 EXPLOSION OF TANK CAR TEARS HOLE IN CITY

Many business buildings in the heart of Ardmore, Okla., were demolished and more than 50 persons killed when a tank car filled with gasoline exploded recently in a railway yard adjacent to the commercial section of the town. The terrific force of the blast caused the discharge of 400 lb. of dynamite which was stored in a freight station near by. The double detonation damaged structures over a large area, crumbling brick walls, shattering the windows of practically every store in the community and razing an entire block of buildings. Without warning, the roofs of business houses caved in upon their occupants, burying many beneath the debris and injuring more

than 200 persons. The tank car was blown far into the air and flaming gasoline belched out in every direction, setting many of the partly demolished buildings afire and adding to the terror of the city, All business was stopped, and the town virtually placed under martial law. The property damage has been estimated at between \$500,000 and \$1,000,000. The explosion is thought to have been caused by a workman who was endeavoring to repair the tank car, which, it is reported, had sprung a leak. It is supposed that in pounding against the container, a spark flew from his hammer and ignited the gas rising from the volatile liquid that had escaped.

MINERS DRILL HOLES IN ROCK 6// FOR PASTIME

Pounding holes in granite would perhaps not appeal to the average man as an enjoyable recreation, but the miners of Cripple Creek, Leadville, and other Colorado towns, seem to ENGINE DISCARDED AFTER

An "atmospheric" engine that has been in service hoisting coal at a colliery near Rutherglen, Scotland, since 1809 has just been discarded to make place for a steam engine of a modern

type. During the 106 years that it was in service this interesting relic of the early days of steam is reported to have given entire satisfaction and to have required no renewals other than that of two spur wheels that were broken by accident. The atmospheric engine represents one of the earliest successful attempts to make practical use of steam power. Steam at a pressure little greater than that of the atmosphere was used, and simply performed the work of pushing the piston to the upper end of the cylinder. In this work it was assisted by a weight hung to the opposite end of the walking beam operated by the piston. As the piston reached the upper end of the cylinder the valve was closed,

Contesting for Prizes as Champion Stedge Artists in Colorado Mining Towns

enjoy it as a sport, and at Fourth-of-July and other celebrations are in the habit of getting up contests to see who is the fastest in the driller's art. One man will hold a chisel-shaped drill, and his partner will hit it with a sledge, several such pairs undertaking to pound their way through the samesized piece of granite at one time. Some wonderful records are made at these contests.

The teaching of chorus music is a new feature in the university extension work of the University of Kansas.

Philadelphia's Harp Orchestra, Possibly the Only Organization of Its Kind in America

HARP ORCHESTRA ORGANIZED

Philadelphia has the distinction of supporting a barp orchestra. A musical organization of this character is doubtless very unusual as a permanent institution, although a band of harps only may have been heard occasionally both here and abroad. The orchestra, consisting of 14 harpists, is composed entirely of women and girl players who have been banded together through the endeavors of a local musical club. Its concerts are strikingly new to Philadelphia and have attracted considerable interest.

DEVICE FOR CLOSING DOORS OF LIFTS AUTOMATICALLY

To meet the New Jersey state law which requires that the gates at the entrances of elevator shafts shall be semi-automatic or automatic in their action, a very simple device has been invented which may be used with either sliding or swinging doors. It is a locking arm which holds a self-closing door open until an elevator is started, when it is

tripped, allowing the door to close. As a door slides into place across a shaft entrance, the arm drops into a slot provided for it and locks the former on the inside. The disengagement of this

This Shows How the Device may be Applied to Both Sliding and Swinging Doors

pivoted arm is effected by means of a tripping member fixed to one wall of the elevator.

CONSTANT-SPEED WINDMILL RUNS ELECTRIC GENERATOR

With the idea of extending a windmill's usefulness, a farmer living on the wide plains of North Dakota has

This Windmill and Generator Furnish Power for a Whole Farm. The Wheel Is Self-Governing

harnessed one of the machines to an electric generator. The current from this generator is made to operate a number of machines about the farm, as well as to light the whole place. The generator is mounted on a swinging boom and turns about the central standard along with the wheel and fan when the wind changes direction. In the rear of the wheel is a large pulley over which the belt from the generator runs, thus making a direct connection, The blades are movable about radial axes, and turn more and more edgewise to the wind as it gets stronger, thus keeping the speed practically constant. A suitable governor controls this function. Storage batteries receive the current when it is not otherwise being used, suitable circuit breakers being cut in on the circuit to keep the batteries from running the generator when the wind dies down below the speed necessary to force current into the batteries against their opposing electromotive force.

DIVIDED BARREL PERMITS EASY HANDLING OF FRUIT

A barrel with two partitions in the middle was recently devised by a Canadian inventor. His object was to provide a safe and convenient container for fruit. The two center partitions of the device were placed close together, enabling a filled barrel to be sawed in two between the partitions if desired, permitting a retail dealer to sell only a half barrel to a customer should that be all the latter cared to purchase. Besides these advantages, the inventor claims that a barrel-shaped container is easier to handle than either baskets or boxes, and that by sawing his type of barrel in two after delivery to a retail store, all the virtues of boxes and baskets are retained. In addition, these barrels may be made of cheap sawed lumber, and shipped in a knocked-down state to the fruit growers' packing plant. Commerce Me

TAKES TWENTY-SIX HORSES

Twenty-six horses were recently employed in moving a huge mine-hoist casting through the streets of Grass Valley, Cal. Two big logging wagons, coupled together, conveyed the casting, which weighed 23 tons. In making a turn at a street corner on a stiff grade, eight of the horses pulled upon a cable running through a pulley. The greatest difficulty was the tendency of the broad wheels to sink into the asphalt pavement. During a halt at the top of a grade, the wheels sank to such an extent that it was found im-

possible to get a new start by horse- COMPACT FIELD-TELEPHON power alone. Fortunately the wagons 3 //OUTFIT USED BY FRENCH stood close to the track of an electric car line, and it was found practicable to give the needed boost by means of an ordinary street car pushing upon a timber adjusted between its front sill and the rear axle of the rear wagon.

GERMANS OFFER MONEY FOR JUNK FROM BATTLE FIELDS

Recent reports indicate that Germany, with characteristic thriftiness, is offering so much per pound for scrap metal gathered up from the battle fields within her territory. Civilians who turn in brass articles, such as used rifle and gun-cartridge cases, and bits of copper, aluminum, and zinc, get about six cents per pound for the collection. For tin cans, and similar articles, about six cents per 10 lb. is paid. Those in the army who do such collecting get only one-fifth the prices paid civilians, thus encouraging the unemployed among the latter to engage in the work.

CUnder an order recently issued, kapok, a vegetable fiber possessing a high degree of buoyancy, will in future be employed as a filling for all mattresses, pillows, and hammock mattresses used in the United States Navy.

second Herrold AMERICAN-BUILT SUBMARINES

CROSS THE ATLANTIC

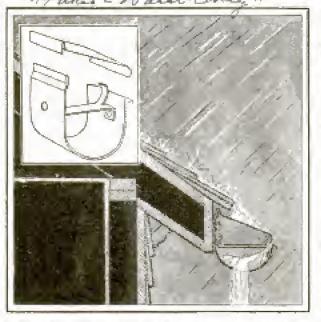

The crossing of the Atlantic by four of the American-built submarines contracted for by the British admiralty is a remarkable feat for vessels of this class. It is also a matter to give a considerable degree of reassurance to Americans, for it we can build submarines like these for other nations we can build them as well, or better, for ourselves. Ten of the submarines were contracted for, and all have been completed. Under a ruling of the State Department the submarines could be designed and the parts made in the United States, but the parts could not be assembled in the form of complete war vessels without violating the neutrality of this country. Accordingly the work of assembling and creeting the submarines was done in Canada. Until all the vessels had been completed, the place where this work was done, now known to be Maisonneuve. near Montreal, was kept secret, and the plant was the most heavily guarded in Canada. Definite details of the voyage of the first four of the submarines from Montreal to Gibraltar, which occurred in the early part of the summer, have been given out, but no information is available as to the present whereabouts of the others. The first four to cross the Atlantic are supposed to be operating in the Dardanelles and are credited with being responsible for the sinking of two Turkish transports in the Sea of Marmora on August 29. Each of the submarines is 160 ft, in length, and is propelled by crude-oil engines when traveling on the surface, and by electric power when submerged. The voyage from Montreal to Gibraltar was made without trouble of any kind and without any great discomfort for the crew. The little flotilla was convoyed by larger warships, and the submarines made the entire trip under their own power, going down the St. Lawrence River to St. John's, Newfoundland, where a stop was made, and then to Gibraltar, where they joined

the British naval forces.

small battery, while in a pocket at the middle is carried an induction coil. The telephone instrument itself is held in a holster worn over the left hip, and when the device is removed from this or returned to it the current is automatically turned on or off. To use the instrument it is only necessary to connect one of its terminals with a wire and the other with the ground.

NEW FORM OF GUTTER KEEPS DIRT FROM CISTERN PIPES

By the simple expedient of using the attraction most liquids have for the surface of the plane upon which they run, an inventor has recently brought forth a device which he claims will keep dirt, leaves, ice, and other undesirable matter, out of eave troughs, and prevent their being carried into cisterns. As can be seen from the cut, he places a metallic cover over the cave trough, the outer edge of the cover being bent inward and down into the trough. Water coming from the roof strikes this cover and follows

Water Sticks to the Cover on This Trough and Runs Inside, while Leaves and Dirt Bound Off

it down into the gutter by a species of capillary attraction. Dirt, leaves, etc., will not follow the surface, but bound off the metal instead of entering the trough.

820 543

GROUND-LINE DISCONNECTOR SAFEGUARDS LINEMEN

Designed for the protection of linemen, a disconnecting device for ground

118ed wires electric poles with lightning arresters has been invented. a Primarily it consists of a small brass casting which may be screwed to a pole several inches above the customary ground pipe. At the top of it there is a 🖹 lug into w h i c h the wire extending down from a lightning ar-

rester is soldered. A slot is provided in the bottom to receive a split plug connected to a flexible wire which is fastened to a cap in the upper end of the pipe. When it is necessary for a lineman to climb a wet pole, which is thus equipped, he pulls out the plug. This breaks the ground connection and eliminates the danger of his crossing himself with the ground line and a live wire. The latter is a contingency which is always possible during miny or excessively damp weather.

PLOWING UP THE SALDURO SALT BEDS

With equipment consisting of a motor truck and a plow the salt beds at Salduro, Utah, which are said to constitute the greatest single deposit of pure salt in the world, are being broken up and utilized as a source of supply for the salt market. The salt in these beds is reported to be 98.21 per cent. pure. It is closely packed and is as hard as silica, with a surface as smooth as glass. The beds are about 65 miles long, vary in width from one to 25 miles, and are in places as much as 25 The salt is loosened by an ordinary riding plow attached by a chain to the rear of a motor truck. As fast as the salt is plowed up, workmen with shovels follow and put it into After a sufficient quantity has been made ready in this way, the truck is unhitched from the plow and makes the round of the piles, the salt being loaded into the truck and taken to the refinery. In this way the truck furnishes both the motive power for digging up the salt and the transportation for taking it away. This use of a motor-driven vehicle on the salt beds is in marked contrast with that which made the beds famous in 1914, when an automobile was driven over their smooth and blinding white surface at the record-breaking speed of 143 miles an hour.

THE EXTREME ACCURACY OF

The fundamental units used in computing the amount of electric current consumed are now established and standardized to a degree of accuracy that goes beyond all possible commercial requirements. Three units are in use. These are the ohm, which measures the resistance, the ampere, which measures the amount of current flowing, and the volt, the unit used in measuring the electric pressure. Four

passage of an electric current by a column of mercury of uniform cross section having a mass of 223.0248

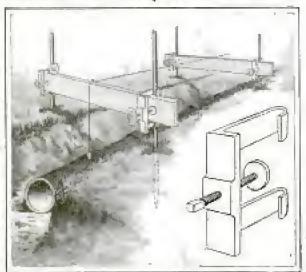

41.8503 in. For making the measurement, the mercury must be at the temperature of melting ice. In each of the ohms made by the Bureau of Standards the column of mercury is inclosed in a glass tube, and the unit as a whole is made with the highest degree of accuracy possible to modern science. In making measurements at the temperature of melting ice, as required, the ice used is made from specially purified water in order to avoid any temperature uncertainties due to impurities in the ice. When the standards were tested electrically the average deviation of the individual standards from their mean value was found to be less than .00001 ohm.

POPULAR MECHANICS

A CONVENIENT CLAMP FOR CONSTRUCTION WORK

A clamp recently invented embodies convenient features. Its principal function is to clamp boards to rods or

The Clamp Is Convenient for Giving Lines and Grades to Sewers, or the Like, as Well as in Heavier Construction Work

stakes driven in the ground. In temporary construction work this is frequently just what is desired, as bolting or nailing parts together often calls for too great an expenditure of time and labor. The tightening wheel which soperates the clamp may be removed to prevent unauthorized parties from tampering with the apparatus while in use.

HAVE CLOCKS TO CONTROL GAS STREET LAMPS

 An eastern firm has devised a way to rid gas-lighted cities of a large share For the trouble attendant on lighting Nand extinguishing individual gas lights deach night. A small clock is installed ;at a convenient point on a lamp-post, yand this clock is equipped with a dial and mechanism which works a valve Top-the gas supply. A pilot light burns when the lamp itself is extinguished, and serves in the usual manner to light the latter when a full supply of Sgas is turned on. The statement is emade that one man can easily look after 250 of these clock-equipped street by lights, doing all the inspection, cleaning, winding, replacing of mantles, etc.

It is further maintained that the annual cost per light to a city can be reduced from \$24 to \$30 to between \$15 and \$21 by use of the mechanism.

SCALE FOR COMPUTING CON-

With a new computing scale that has just appeared on the market the amounts of the ingredients required for different quantities and mixtures of concrete are read off directly without the necessity for computation of any kind. The scale is made for three different mixtures of concrete. It consists simply of a square piece of cardboard to the center of which is pivoted a cardboard disk. On the lower cardboard are three sets of figures, each set consisting of three circular rows, while outside the whole is a single row of figures giving the quantities of concrete to be mixed. All the figures except the outside row are covered by The individual figures of the disk. each set fall on radial lines so that they can be read through one of the slots in the disk. In using, the slot corresponding to the mixture required

on a slanting arm attached to one side of the frame, and this pressure is varied by taking off weights or putting on additional weights. The blade is tightened by means of a handwheel at the top of the machine. The limit of the length of a cut is 20 in. Since the table stands only 26 in. from the floor it is comparatively easy to handle material to and from the machine.

CONCRETE CULVERT MADE IN INTERLOCKING SECTIONS

590

One difficulty in the making of concrete culverts is that the mixers, forms, etc., have heretofore had to be assembled on the site of each job. Since culverts are ordinarily small jobs, such continual moving around of men and machinery is inefficient and wasteful of time. With the idea of keeping culvert manufacture localized at one place, and assembling the culverts as needed, and at the place of erection, a Chicago firm has recently put a culvert on the market which is made up of separate and interlocking sections.

It is claimed that the new culvert has all the features of the older styles, including expansion joints as a protection against temperature changes, flat bases, straight sides, and a smooth in-

rangement it is not necessary to move heavy pieces in feeding. The pressure of the saw is obtained by weights hung

terior. It is easy to make, and of course any number of sections may be assembled to suit the requirements of a given job. Thus long or short culverts may be made with equal ease.

FOREST-FIRE STATION ON SUMMIT OF MOUNT HOOD

DURING the summer of 1915 an innovation in the work of fighting fires in the national forests was brought about by the installation of a fire observatory on the summit of Mt. Hood, one of the five highest mountains of the Pacific Northwest. Mt. Hood stands 11.225 ft, above sea level. and even in midsummer the weather conditions at the summit are at most times severe. The establishment of the station was largely an experiment on the part of the government, there having been a great deal of doubt before the experiment was tried as to whether an observer could stand, for an entire season, the lonely existence, the high altitude, and the storms. This point was conclusively settled by a mountain guide whom the government employed as an observer. This guide, who had already made 350 ascents of the mountain, succeeded in establishing a camp on the summit and spent the entire summer there in comparative comfort. So successful did the experiment prove that toward the end of the season the government built a wooden observatory building on the summit. This building will serve as permanent quarters for the Forest Service, and in addition to this, will be used as an observatory for the United States Weather Bureau. As a result of the satisfactory outcome of the experiment, plans have also been made for the installation during the year 1916 of a number of other snow-peak observatories.

When it came to establishing the fire observatory on the summit of Mt. Hood, the work of getting the necessary equipment and supplies to the top proved to be a big undertaking. Above the 6,000-ft, level the mountain is continually covered with snow, while the slopes are so steep and treacherous as to tax the resources of the most There are skillful mountain climber, two routes to the summit, one up the south side of the mountain and the other up the northeast side. Just below the summit, on each of the routes, where the slopes are particularly steep

and perilous, a steel cable has been, anchored to the mountain side, and it is only with this that the climb can be made with any degree of safety's The cable on the south route is 800 ft. long, and that on the northeast route, 1,800 ft. long. The 4,000 lb. of material required for the camp was taken up the south route. Pack mules were used for transporting it up the mountain side and across 21/2 miles of the snow zone to the 8,000-it. level. From this point the climb was too steep and dangerous for this mode of transportation, and the material was carried the remainder of the way to the summit on the backs of the observer and an assistant. Dangerous crevasses in the area crossed by the cable made the work of transport extremely trying, but after five days of strenuous work the material had been carried to the top without accident of any kind. At? the summit there is a scant two acres of fairly level snow-covered ground with little in the way of mounds or depressions to furnish shelter. daily east winds swinging down from the Columbia River, a short distance to the north, often tear at the peak with the fury of a hurricane, while even in midsummer the temperature sometimes drops nearly to zero. To resist the high winds, the tent, 12 it. square, was not only securely guyedbut was heavily weighted around the sides. It was provided with a double floor. A comfortable bed of Hudson Bay blankets and a sleeping bag, a liberal stock of food, instruments for making observations, and a few books, constituted the living and working equipment of the observer. With the pioneer work done, the transporting of material for the permanent wooden building at the summit was carried out with less uncertainty and danger. An adequate and well-organized force of men was employed, but even under these conditions the transportation of 5,000 ft. of lumber to the summit was a big task.

With the camp established, it was next necessary to bring a telephone

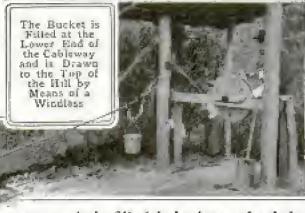

line up to the summit. For several years a lookout station had been maintained on the south side of the mountain at an elevation of 6,300 ft., the wires leading from the valley below to this station being strung from tree to tree along the trail after the usual manner of forest-telephone construc-This line was first extended to the 9,000-ft, level, the reels of wire being carried on the backs of pack mules, From this point the wire was dragged to the summit by the observer and his assistant, the last 800 ft, being so steep that the wire was pulled to the top Five miles of line was with ropes. required for connecting the lookout station with the summit. The wire used is of copper and is covered with a rubber weather insulation. No attempt was made to use poles, the wire being rested on the rocks and snow and stretched across chasms as they were met. Owing to its weight the wire sank into the snow from 10 to 14 inches, and with the continual melting and freezing soon became imbedded.

and anchored in solid ice. Several times during the summer the ice split in crevasses, breaking the wire, and this caused the rangers a great deal of trouble in making repairs. Next year a heavier telephone cable is to be installed, and, if it is found feasible, poles will be set in the solid rock to carry it.

At the summit there are two observation stations, one being located at the eastern and the other at the western edge of the plateau, and with this arrangement the forests for hundreds of miles in every direction are visible. At each station there is an instrument for sighting on a fire and getting its bearing with reference to the points of the compass. This bearing is reported by telephone to the supervisor's office where it is combined with a bearing taken in a similar manner from some other mountain top, and the exact location of the fire is quickly determined. During the summer the ob-server on Mt. Hood discovered and reported hundreds of fires.

CRUDE AERIAL CABLEWAY FOR CARRYING WATER

A crude but efficient acrial cableway is used by a mountaineer living near Asheville, N. C., for transporting water from a spring, located in a deep ravine, to his house, 289 ft. distant, the whole apparatus being operated by a single haulage rope that winds around a windlass at the top of the hill. The cable is simply a strong steel wire on which runs a bracket with the water bucket suspended beneath. When water is needed, the bucket is let down to the end of the line, where it stops under a spout fed by the spring, and as

soon as it is filled it is drawn back by means of the windlass.

German farmers have been advised to conserve nuts and fruit seeds, from which the government probably will attempt to extract vegetable oils.

COMMENTAND REVIEW

THE big guns and the gas bombs have been in the spotlight at intervals, but submarines and air craft are unmistakably the star actors in the present war. For the first time each has a record of

Submarines and Aeroplanes Star Actors really practical work and valuable results. In the air, the aeroplane is acknowledged to be the real dependence. As predicted in these pages a year before the war, the dirigible as a war weapon can be counted a failure. True, a few trips have been made in good weather, crossing the English Channel, and dropping a few bombs, which have in the whole year's war killed

less than 200 people, and these mostly women and children. For a large fleet, each vessel of which cost \$500,000 or over, this cannot be considered much in the way of result. No battle has been won or even affected by use of a dirigible. It has unquestionably been an awful nightmare to the British, but when the worst it has done and all it has accomplished are summed up, the dirigible to date must be declared more a menace than a real danger, and largely a fiasco. In fact, every German dirigible which has crossed into England has easily recruited 10,000 men to the British colors. Therefore, on account of cost, dependence on good weather, its size as a mark, and small results, it is now fairly well established that the dirigible, as a military weapon, has lost out.

The aeroplane, on the contrary, that far-reaching eye that sees over mountains and around corners, has more than justified itself. Within the zone of activities an army can no longer begin any important change of base, or advance, or even start a retreat, without its being almost instantly known to the enemy. The perilous work of the spy, so important a few years ago, is now largely taken over by the aviation corps, for a single aeroplane with one pilot and an observer can in lifteen minutes bring in more accurate information than a dozen spies could secure in twenty-four hours, with the additional great advantage of the report being right up to the minute. And as for bomb dropping, if homes and hospitals and churches are still to be destroyed in so dastardly a fashion, the aeroplane is capable of enough mischief to quite compete with the dirigible. The aeroplane is so small a mark, so hard to see, and can change its course so suddenly and often, that the aerial guns have fallen far short of their expected efficiency.

While the submarine has sent a large number of unarmed merchant and passenger boats to the bottom, it has as yet, perhaps for want of opportunity, shown meager results as against men-of-war. All life is alert to protect itself against attack and destruction. As Burbank says, the cactus had no spines until it was threatened with annihilation by antelopes, and the submarine had free hand until recently. Already means have been devised which tend to limit the possibilities of under-sea craft: They are taken like fish in wire nets; they are set upon by a mosquito fleet of small speed boats, armed with one-pounders, when they show themselves. On the other hand, the submarine has demonstrated most satisfactory abilities for long voyages, as, for instance, one of our own submarines recently made the

voyage from San Francisco to Honolulu, a distance of over 2,000 miles, without once stopping its engines. However, for protection of our enormous coast line, a large fleet of submarines seems inevitable.

BY reason of his past achievements and well-earned renown, the words of Thomas Edison, chairman of the General Science Board, printed on another page, are those of one speaking with

War Machines Need Men authority. When he declares for largely increased arsenals, located at places not easily accessible to an enemy; for machinery of vast capacity, and a supply of raw materials on hand with which to work, he unquestionably voices a sentiment approved by the great majority. All these provisions should be made, and promptly, and a great deal more. He says we

are a nation of machinists and hopes to find our defense in machines instead of men.

But can we? The present war has had at its service all the known means of combat of former wars, as well as aeroplanes, wireless, electric lights, motor cars, submarines, telephones, gas bombs, liquid fire, and high-power, long-range guns. Never were so many mechanical devices employed in any war and never were so many men required to work them; never the fatalities so large.

There is a bit of delusion about labor-saving machinery making labor unnecessary. There never were so many labor-saving devices nor so many occupations for the human hand and brain as today. The labor-saving machine transfers labor, but does not permanently displace it. Hence, however ideal Mr. Edison's hope for invention to supply machinery of defense, machines can never, unfortunately, take the place of large bodies of trained men. The nation with both machinery and men will defeat the nation with men only or machines only.

Let us have all the machinery possible, but let us not delude ourselves by placing too much reliance on machines and motors instead of on mind and muscle.

A T last as a nation we are waking from long years of comfortable, indifferent lethargy, and the cold fact is staring us in the face that our boasted strength is a myth. If attacked today we have, as

Preparedness compared to other large countries, very little in the shape of coast defense. We could be whipped a dozen times while we were organizing for protection. The kind Providence which has watched over us thus far should not be overworked; we must now do for ourselves.

The plan for increased army and navy which the President will send to Congress will meet with approval by the large majority of Americans. Such substantial increase in equipment calls for a corresponding increase in men. Privates and sailors can be trained to a fair degree of usefulness in a few months; but officers,

such as this country needs, require several years in the making. At present we have one military school, West Point, and one naval academy, Annapolis.

The present capacity of West Point is about 700, with an average

annual graduation of only 130.

During the present war the English have frequently lost in a few days more officers than the entire yearly graduation at West Point. In view, therefore, of the fact that the training a young man receives at the military academy specially fits him for life work of a high order as a civilian, it would seem advisable to increase the number of military academies by establishing one in the central West and one on the Pacific coast. The graduations of all three would in time produce 600 or 800 trained officers per year. Even at this rate, deducting deaths and disabilities, it would require at least 10 years to produce a total of 5,000 officers; and this assumes doubling the capacity of West Point and building two more schools equally large.

In these days, mere courage, of however high an order, will not compensate for lack of training in the officer; and now that armies are spelled in millions instead of thousands, the necessity for officers

by the thousand becomes evident.

The United States Naval Academy at Annapolis, established in 1854 and enlarged a few years ago, has a capacity of 1,200 and an average annual graduation of 165. Somewhere on the Great Lakes and on the Pacific coast sister naval academies could well be operated to advantage, providing in time reserves of trained men available when needed, but who otherwise would engage in various industrial, professional, or engineering occupations.

PRACTICALLY all the great powder mills in this country are along the Atlantic coast within easy striking distance by an enemy. Mr. Edison's suggestion that new arsenals of ample size, capacity, and

Arsenals in the Central West numbers should be erected in the central West will find general acceptance. Most people will go a step farther and, also, in addition to vast stores of raw material, will want generous supplies of the manufactured product ready for instant use.

In a way, the present war has accomplished for

us, automatically, the construction of a large number of machines for producing ammunition and the training of men in their use. At the end of the war it might not be desirable or economical for our Government to purchase such machines as are still in excellent condition; but at least we can do what Germany has done. For years every new lathe which has gone into a German machine shop has been so constructed that it could be quickly changed from its normal use to that of making shrapnel. With their usual thoroughness, the war office knew at all times the location, number, size, capacity, and condition of all these machines. Thus it had at instant command, with trained men to operate them, thousands of machines already organized for service. Our own machine shops may well cooperate with our Government in a like manner to the good of each.

IT is getting to be almost a misdemeanor to possess an American flag in Massachusetts; and Boston, with memories of Paul Revere and Bunker Hill and Lexington and Concord, is the chief exponent of

An Absurd Law a most absurd law. It is ruled that the use of the American flag as any part of the illustrated front cover of a magazine is a debasement of the flag to purposes of advertising. Even a glass paper weight, devoid of a single word, cannot be sold or given away, if it contains the flag.

During the past few months three excellent magazines, of national reputation, were barred from circulation in Boston, under penalty of heavy fines—and what was the "offense"? On one a group of aged women were portrayed in the diabolical act of sewing an American flag; in another a Fourth-of-July girl had two small American flags in her hair, and the third showed the flag with patriotic quotations from the President of the United States printed below.

In each instance the flag was used in a dignified manner. What more impressive than the bent form of white-haired motherhood fashioning with trembling fingers the stars and stripes? What more beautiful than young womanbood, with all the charm of grace and beauty, espousing the flag which has given more to daughters and mothers than any other flag on earth? What more appropriate than that the momentous words of the commander of the Army and Navy should find expression beneath Old Glory, to honor and protect which he has taken his solemn oath?

At heart we are sound, but in our desire to avoid the semblance of devotion to royalty we have gone to the other extreme.

For fear of appearing sentimental, we reluctantly arise when the national anthem is played; we see its folds break from the peak with covered heads and faint applause. Must we have another scourge of shot and shell to teach us the lesson of its worth?

What we need in this great melting pot of nations is not less American flag but more of it. Let it fly from every schoolhouse, in every state; let it unfurl when our courts of law convene; let its folds drape our pulpits; give it a place in every shop, and office, and home. Let our girls wear it in their hair, and our boys wear it on their breast. Let it not be the emblem of a holiday, but let it find its response from the first words of first-born all the way through life, and with his last breath let him praise its grandeur and bequeath its trust to children's children.

Motor Stage in Service in Colorado: As a Protection against Robbery, the Mail, Express, and Other Valuables are Carried in the Wire-Mesh Cage at the Rear

MAIL AND EXPRESS CARRIED IN BANDIT-PROOF CAGE

In a section of Colorado that is without railroad facilities there is in regular service a motor stage equipped with a bandit-proof cage for carrying the mail and express and other valuables. The cage occupies the rear of the car, leaving space at the front for 16 passengers. It is made of wire mesh and is so strongly built that it would require much time and labor for a bandit to break into it, and it is on the latter feature that dependence is mainly

placed for the safety of the valuables. While it might be an easy matter to overcome the single armed messenger, who rides in the cage, it is not believed that any bandit would risk spending the time required for breaking through the heavy wire mesh. For service in less thickly populated sections where this consideration might not act as a deterrent, the plan has been suggested of substituting for the cage a beavily armored compartment equipped with loop holes. The car as proposed is shown on the front cover of this magazine.

TALKING ACROSS THE OCEAN BY WIRELESS

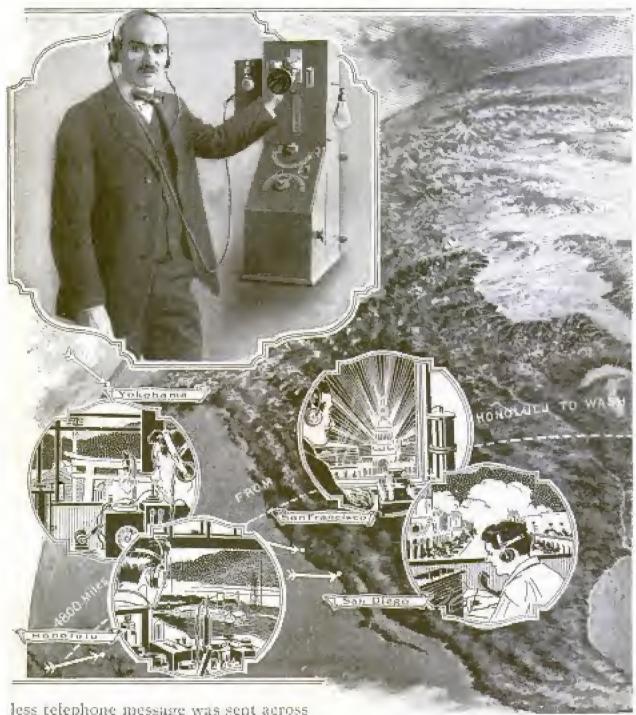

773

BY JOSEPH E. MURPHY

S IX months ago experts were talking of the tremendous obstacles in the way of transmitting the human voice over long distances by means of wireless. This seemingly impossible feat has now been accomplished, and the accomplishment has come with startling suddenness. On September 29, in a test of a new apparatus, the details of which have not yet been made public, a telephone message was transmitted from the wireless station at Arlington, Va., to the navy yard at Mare Island, near San Francisco, a distance of 2,500 miles. Remarkable as

this feat seemed at the moment, the actual accomplishment was found to be tremendously greater than supposed, when, on the following day, a cable message was received from Pearl Harbor. Hawaii, about 4,800 miles from the source of the wireless waves, saying that the conversation had been heard at that point. Subsequently it was found that several other distant wireless stations, among them the one at Darien, Panama, had also picked up the message. Three days later, when communication was established with the Eiffel tower in Paris, the first wire-

Inventor: Dr. Lee De Forest, 159, Sedgwick St.,

less telephone message was sent across the Atlantic. This message was also picked up at Pearl Harbor, the voice at Arlington being thus heard at two points about 8,000 miles apart. At the present writing, plans are being made to attempt wireless conversation with stations in China and Japan. As a preliminary to this supreme test communication will first be established with Alaska. A hint as to the revolutionary changes likely to be brought about as a result of these accomplishments is given in a statement credited to the

secretary of the navy, in which it is predicted that as soon as the new apparatus is perfected it will be installed on the ships of the American navy, where it is likely in large degree to supplant the wireless telegraph. In this wireless apparatus, as well as in the new transcontinental telephone line, a device known as the incandescent audion amplifier is an essential part of the equipment.

What is perhaps as striking a feature

as the distance over which the voice was transmitted in the first test, is the fact that the message was started from a telephone in an office building in New York City and made the first lap of its long journey over an ordinary telephone line, the electrical impulses carried over the wires being automatically converted into wireless waves by a transformer at the Arlington station. Such a combination of new apparatus opens practically unlimited possibili-

ties. Sitting at a telephone a thousand miles inland and talking with Europe or Asia, or with a ship at sea, by means of a combination of wire and wireless transmission is a possibility of the inmediate future, and is apparently only a matter of building apparatus having the required power.

Simultaneously with these developments in wireless telephony, long-distance telephony by wire has been making enormous strides. One of the features of the Panama-Pacific Exposition is a theater in which the audience listens to conversation in New York and to the roar of the surf on beaches of the Atlantic, all this being transmitted over the new transcontinental telephone line. Recently a chorus composed of 5,000 voices in Boston sang "America" and "The Star-Spangled Banner" to an audience in this theater, and both the singing and the applause that it elicited were distinctly heard across the continent.

An added touch of interest is given to these various accomplishments through the fact that they occurred at the same time as the first successful use of the long-distance telephone by Thomas A. Edison, an impossible proceeding for the famous inventor, on account of his deafness, until the sound amplifier had been placed in service. At the instant the first wireless telephone message was being transmitted to Paris, Mr. Edison was talking from San Francisco with his home in Orange, N. J., and a few moments later the line at Arlington was "cut in" with Mr. Edison's line, and he was informed of the feat. In his first talk across the . continent the inventor used a line in which were many relies of the early days of electricity, among them being a short stretch of wire over which Samuel Morse sent his first telegraphic message, and another section of wire used by Alexander Graham Bell in sending his first telephone message.

785 NATIONAL DEFENSE

That machines—not men—are to be the determining factor in any future war that this country may be called upon to light is the opinion expressed by Thomas A. Edison in a recent interview. On the basis of that opinion he believes that the country should depend for its safety, not on a large standing army, but on facilities constantly maintained and ready for instant use, with which the machinery of war could be quickly produced on an enormous scale in case of a crisis. Equipped in this way, a volunteer army is all that the country needs, provided—and this point is emphasized as one of vital importance—there are enough trained officers, ready for service within 48 hours, to lead and drill the new men. This, in a general way, is the inventor's solution of the problem of national preparedness, a problem that is claiming the attention of the American public as never before in the history of the country. In his opinion "the soldier of the future will not be a saber-bearing, bloodthirsty savage, but a machinist.

"Consider the great amount of powder that is being shot off on the European battle front every day." Mr. Edison said in explaining the details of his plan. "I would have great factories built in which twice as much powder as that could be manufactured, and I would locate and have stored away enough material to make up that powder. As to shells, I think it is a wasteful thing to make them on lathes as they are made now. We should get up special machines for making them rapidly and in enormous quanti-Then I would grease the maties. chines and store them away with a great quantity of steel billets ready to be worked up on short notice. In fact, I would make my preparation potential rather than kinetic, and I would do it right away. The problem should not be a military one at all. It should be done solely on a business basis. But I would keep this in mind in preparing to make stores and ammunition: I would prepare to turn out right along twice as much as is being used now on the whole European battle field-then not make it."

"The people of this country are the greatest machinists," Mr. Edison explained further, "and they can invent machinery faster and have it more efficient than any other two nations combined. This is a machine nation—its battle preparations should therefore be with machinery."

PANAMA CANAL BLOCKED BY 74 EXTENSIVE SLIDES

As the result of a succession of slides in the Gold Hill section of Gaillard Cut, that began on Sept. 18, 1915, the Panama Canal is blocked to all traffic and, according to present estimates, will probably remain so until the end of the year. This is by far the most serious incident that has occurred since the opening of the canal more than a year ago, the slides having practically obliterated a 1,300-ft. section of the channel. According to latest reports, about 200 feet of this section has a width of only 25 ft, and a depth of from three to 15 feet. At one point an island has formed in the middle of the canal, leaving a channel on each side in which the maximum depth does not exceed 15 ft. The normal width of the canal through Gail-

depth, 45 ft. The most serious feature of the situation is that at last reports the earth was slipping into the canal as fast as the dredges were taking it out. Something like 175 acres of land is involved in the slide, and it is estimated that 10,000,000 cu. vd. of earth The present rate of exis in motion. cavation is about 1,000,000 cubic yards a month. Before a permanent channel can be opened, all this, and probably more, must be dug out, although the canal can be opened to traffic as soon as a channel 100 ft. wide and 30 ft. deep has been made. The time required to do this is uncertain, since it depends entirely on the future action of the moving earth above the canal prism. One of the measures taken to diminish the cause of the slides is that of blasting away the tops of the hills, thus taking away some of the weight on the affected section and bringing down immediately as much as possible of the loose earth that might cause trouble in the future.

HORSE IMPRISONED BY FALL THROUGH COALHOLE

The Drawing and Photograph Show Horse Imprisoned in Coal Hopper, and the Manhole through Which He Fell

One of two heavy draft horses hitched to a coal wagon, which was being unloaded at a St. Paul, Minn., bank building recently, became frightened, backed into a manhole, and fell into a large scale coal hopper beneath

the sidewalk. This hopper consists of an iron box, suspended in the basement of the structure, in which fuel is automatically weighed before it is allowed to pass into a chute. The coalhole through which the animal fell is 32 in, in diameter, while the only other exit from the hopper is the trap at the mouth of the chute, approximately a foot square. The horse tumbled in hind foremost and in so doing slipped out of his harness. He was uninjured by the accident. The problem of removing him was a vexing one. It was finally solved, however, a day later by tearing a hole through the concrete sidewalk and basement ceiling and hoisting the horse by means of a small derrick, after he had been blindfolded and bound. An unsuccessful attempt was first made to remove the animal by drawing him back through the manhole. The impracticability of this was soon made ap-While he was imprisoned. parent. food and water were lowered to him through the coalhole.

ELECTRICITY TO HAUL HUGE TRAINS OVER ROCKIES

During the months of 1916 a curious procession will be making its way across the United States. One by one, and about ten days apart, 42 of the largest electric locomotives in the world are to be freighted cross-country from the shops of an eastern manufac-

POPULAR MECHANICS

turer to the lines of the Chicago, Milwankee and St. Paul Railway in Montana. - There a stretch of 440 miles of most difficult mountain railroad was recently electrified, and over the long, steep hills of this line these locomotives are to run, oftentimes singlehanded, to do the work that the united efforts of two to three steam locomotives can barely accomplish at present.

Direct current at 3,000 volts is to be supplied to the trolley on this new stretch of electric railroad, a new and unusual practice. Eight huge motors, connected to as many pairs of drivers, will propel each locomotive. Because of the high potential from the trolley, the eight motors have to be grouped in four pairs, the two motors in each pair being connected in series so that no more than 1,500 yolts can be im-

pressed across each motor at any one time. Each locomotive will be capable of exerting more than 3,500 hp., and those of passenger design are intended to pull an 800-ton train at 65 miles per hour on level track, or the same load at 25 miles an hour up a two-per-cent In external appearance the grade. locomotives much resemble steel passenger coaches, and are divided in the middle to permit easy turning of curves. Each is 112 it. 8 in. long, which is said to be over 22 feet more than the largest Mallet locomotive now in service.

An additional and unusual feature of these locomotives has been called "regenerative braking." That is, when a heavy train pulled by one of the engines starts down grade, the power to the motors may be shut off and the motors themselves turned into generators, thereby supplying the line with power instead of taking it away. Thus on this new kind of a railroad, a train going down a mountain may furnish a portion of the power to pull another up. By this system, not only will power be saved, but wear on brake shoes will be lessened because of the braking effect of motors acting as generators. The power will come from

ELECTRIC CAR STOOD ON END IN SWOLLEN CREEK

Out of 67 passengers riding in a motor car on an electric line near Randolph, Kan., few escaped unburt when

Position of Electric Car After It had Plunged through the End of a Washed-Out Bridge

the car, traveling at high speed, plunged through the end of a bridge that had been washed out a few mobefore. The washout was caused by a flood in the creek, in which the water rose 4 ft. in a period of two hours. The first warning given the motorman came when the shock caused by the dropping of the forward end of the car threw him through the window of his vestibule. Following this, the car hung for a moment on the end of the bridge. It then toppled and slid forward into the creek and finally stood on end in 12 ft. of water, the passengers being piled in a heap in the forward end of the car. Seventeen of the passengers were killed and 37 injured. A few of the survivors smashed the windows and jumped into the water, but most of them made their escape by climbing up to the rear end of the car by means of the seats and window ledges and then jumping to the bridge. A number of the latter were injured by slipping and falling back when nearly at the top. Most of the passengers were school-teachers on their way to a school convention.

COn every hotel, apartment building, and private residence in Los Angeles, under the terms of a new ordinance, a tin tag must be displayed bearing the name of the property owner.

DETAILS OF THE GERMAN 784 42-CENTIMETER GUN

Although the 42-cm. gun used by the Germans in battering down the fortifications at Liège and Namur attracted world-wide attention during the early stages of the war, the secret of its dimensions and other features has been so jealously guarded that practically nothing has been made publie in regard to this monster mortar. terrible the destruction beyond wrought by it. At a recent meeting of artillery engineers at Düsseldorf, Germany, an engineer of the Krupp works delivered a lecture on the making of heavy artillery and particularly on the making of the 42-cm, guns, or the "Big Berthas" as the Germans call them, and an apparently reliable report of this lecture has been transmitted to this country. According to this report, the big gun weighs about 971/2 tons, while the base on which it stands when in firing position weighs 411/4 tons. The barrel is 16 ft. long, and the shell fired from it is about 50 inches long and weighs 880 lb. The gun is far too big to be transported on any kind of gun carriage. It is made up of considerably more than 100 pieces, and must be taken apart and loaded on motor trucks, of which 12 are said to be required, when it is to be moved.

Unloading, assembling, and mounting the gun is a big undertaking that can only be done by specially trained workmen, and that requires more than 26 hours of continuous work. A pit of large diameter and about 26 feet deep is first dug, and in this a massive foundation is built of heavy wooden beams. On this the base of the gun is mounted. Within the foundation are placed specially prepared packages of dynamite for blowing up the gun and its accoutrements in case the enemy gains control of the position. For this purpose electric wires are led to a concealed and protected position more than a mile from the site.

Owing to the terrific concussion the gun can only be fired by electricity and from a distance exceeding 300 yards. Even at this distance the crew must wear cyc, car, and mouth protectors, and must lie prone when the shot is fired. There are said to be 25 of these mortars in existence at the present time. A crew of about 200 men is required, and each shot costs about \$2.750.

A large part of the destruction attributed to the "Big Berthas" was in fact caused by the less ponderous 30.5-cm. (approximately 12-in.) Krupp and Skoda mortars. The 42-cm. guns have been fired only a few times, but on these occasions the destruction has been almost unbelievable. The first shot, which was fired at one of the Gruson turrets at Liège, killed 1,700 men, the shell striking about 15 feet in front of the cupola and exploding with such terrific force that the turret and armored chamber below were literally torn to pieces. This shot was fired from a distance of over 13 miles. The second shot fired is said to have killed or disabled more than 2,200 men. No one not connected with the German artillery is ever permitted near the 42-cm, gun when it is in firing position. It is said that no photographs have ever been made of it, the pictures purporting to represent this gun, widely published at the beginning of the war, being in fact photographs of the 30.5-cm. Krupp and Skoda mortars. 814

POWER CRAFT SWEEPS WATER AT MILE-A-MINUTE CLIP

After carrying off the honors in the American speed-boat championship races at Chicago, the "Disturber IV," a 40-ft, hydroplane, recently attained the remarkable speed of 62 miles an hour in a trial over a half-mile course in Lake Michigan. This establishes the craft, which was built in 1914 to contest for the British international trophy, as the world's fastest boat.

It is equipped with two 12-cylinder motors which develop approximately 1,800 hp. It is considered very seaworthy and rides beautifully on an even keel, 782 - 21. 12.

GREAT SECTIONS OF AFRICA MADE DESERT
BY DRYING UP OF SURFACE WATERS

It has long been known that the two "dry continents," Asia and Africa, were gradually becoming drier, but the rapid rate at which the latter continent is losing its surface waters has only recently been revealed, through a report made public by the Smithsonian Institution. The alarming feature of this condition is that it is in no sense local, but affects practically the entire continent. Within a period of less than 50 years thousands of square miles of once fertile land in widely separated districts have been transformed into desert, the earth having apparently acted much like a gigantic sponge in absorbing the surface waters. serious is the condition that now exists in Africa that it is enough to give some grounds for the belief held by a famous French astronomer that the continuous drying up of the earth will gradually result in the destruction of all life.

As a result of this increasing dryness some of the biggest bodies of water in Africa have been seriously affected. Lake Ngami, for example, located about 1,000 miles northerly from Cape Town and once a lake of importance, is now a marsh threatened with speedy extinction, and there is every reason to believe that the surrounding country will soon become hopelessly sterile. About 2,000 miles northeast of Lake Ngami is Lake Rudolph, in British East Africa, This lake, the center of the drainage of the Abyssinian highlands and of a large part of the great equatorial plateau, is shrinking at an alarming rate.

The most serious case of the damage wrought by the increasing dryness of the African continent, however, is that of the Waterberg, a district comprising thousands of square miles in northern Transvaal. The name Waterberg was given this country for the reason that it was copiously watered by lakes, springs, and streams, and was dotted with marshes. It was an exceedingly fertile land and was the last stronghold

Smithenian of gratetution

of the big game of northern Transvaal. Today, after the culminating drought of 1913, it is practically a desert, with dried-up watercourses and springs, dead orange groves, some of which are over 50 years old, forests centuries old that are now lifeless, and desolate pasture lands that are devoid of cattle, There are few or other animal life. wild animals remaining in the Waterberg, and the fields where fine crops once grew are now parched and dead. Last year there was no running water in the entire Waterberg, while in the north of the district there is a tract comprising 4,000 square miles where not a drop of water, running or stagnant, could be found above the surface of the ground. The great Limpopo River is dry for its entire course through this district, and it is only by digging deep in its sandy bed that drinking water can be obtained.

Over everything in the Waterberg lies the silence of absolute lifelessness, the once fertile land having been taken over, apparently for all time, as a part of the desert. For four and a half hours every day the temperature is never less than 100° F. The heat combined with the absence of moisture has had a striking effect on the habits of such animals as remain. The nocturnal ant bear is forced to search for its food in broad daylight, since the ground has become so hard that the ants cannot be dug out in a single night. Most of the nocturnal beasts of prey hunt during the night as well as the day. Contrary to their habits, leopards on one occasion raided a camp in the early Baboons, usually afraid afternoon. of the dark, seem never to sleep, but prowl about day and night in search of food in any form. Animals not well equipped to dig for water, follow those more fortunate and use their water holes, the wart hogs particularly being followed all day long by a retinue of other animals awaiting an opportunity to slake their thirst. On account of the heat and drought the wild dogs that infest the country have become more savage than ever, driving in packs day and night and attacking all 1.

animals. They are even credited with having caught and killed an ostrich, previously an unheardrof thing. party of travelers digging for water in the bed of a dried-up stream unearthed a living crocodile, also in search of water, more than four feet below the surface. Certain species of white ants are apparently the only kind of animal life not affected by the extreme conditions. Vast numbers of these ants come out of their holes at midday, form in a compact ball and lie in the sun, although the ground is so hot that the bare hand cannot stand contact with it for more than two or three seconds.

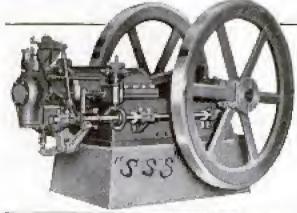

One of the things for which the Waterberg was famous was its sweet grass. This is gone, and in its place has come a coarser sour grass that has peculiar drought-resisting qualities. The seed of the sour grass is one of the marvels of plant life, its actions under certain conditions being such as to raise a doubt as to whether it is really a seed or an insect. The body is shaped like a torpedo and is equipped with a long tapering tail. When magnified, the seed is seen to be studded all over with sharp, stiff bristles, set backward, while on the head is a horny spike, sharp as a needle, with a crown of harpoon points at its base. seeds not only drift about with the wind but cling to the backs of animals, and even penetrate the skins of animals and human beings; causing both discomfort and danger. When water is sprinkled on a bunch of the seeds a curious phenomenon results. seeds first disentangle themselves. The seed head is next lifted clear of the ground by the tail and the needle point is then thrust into the damp soil by a continuous pressure of the bent tail against the ground, this movement continuing until the seed is imbedded in the soil. The whole operation takes about 15 minutes. Here the seed lies dormant until a little rain falls, which insures the safe sprouting of the plant. Thus equipped, the sour grass thrives in spite of the severe drought against which the sweet grass is helpless.

CRUDE-OIL ENGINE WORKS AT LOW PRESSURE

A crude-oil engine that operates on a principle somewhat similar to that of the Diesel engine, but at a lower pressure, has recently been introduced. and is said to be giving satisfaction as a reliable and cheaply operated power plant. In this engine, which is of the four-cycle type, the crude oil is first taken into an auxiliary cylinder where it is agitated and where some of the lighter hydrocarbons are separated from the oil. These light hydrocarbons ignite at a considerably lower temperature than crude oil, and it is the utilization of this condition that forms one of the principal features of the engine. This cylinder has a connection with the main cylinder consisting of a hole about the size of the lead in a lead pencil. During the compression stroke of the piston of the main cylinder a small portion of the air contained in this cylinder is forced through this hole into the auxiliary cylinder, and owing to the resulting compression the light hydrocarbons are fired. The resulting explosion forces the oil, which constitutes the main charge, into the main cylinder where the air by this time is at a burning temperature, and the main explosion takes place. It is said that back-firing and preignition are impossible, and that

New Crude-Oil Engine in Which the Charge is Forced into the Main Cylinder by the Pre-liminary Explosion of Light Hydrocarbons

the engine can be operated at a cost of approximately one-half cent per horsepower-hour.

MARKSMAN TRIMS TALL TREE WITH HIGH-POWER RIFLE

It is approximately 120 feet from the ground to the lowest branches of a giant eucalyptus tree which stands alone,

sentinellike in the Santa Clara Valley near San Jose, Cal. The total height of the tree is about I40 feet. present form is due to trimming, which was accomplished in a m ost unusual way. The owner of the ranch on which the encalyptus stands is

adept in handling a rifle, and this be used in stripping off the branches. A large number of shots were required to sever some of the big limbs, but the feat was ultimately accomplished, as the gaunt tree bears witness.

2-4-4 BACK FILLING PIPE TUNNEL THROUGH AUGER HOLES

Interesting engineering work was recently done in completing a section of the new Denver water conduit which connects the north tower of Marston Lake with the city piping system. At Loretto Heights, in order to keep the line at the required depth, it was necessary to place the 48-in, main at a depth of 36 ft. beneath the ground. A tunnel was bored for a distance of

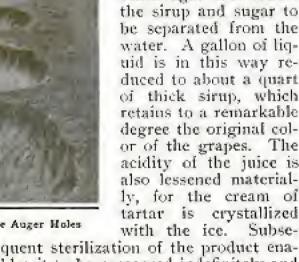

Denver Union Water too.

850 ft., instead of making a cut. This subsequently had to be back filled. To JET BY FREEZING METHOD obviate the necessity of drawing the dirt into the passage from the portals and shafts, 8-in, auger holes were bored from the tunnel to the surface of the ground at intervals of about 10 ft. These were then enlarged by workmen and loose dirt filled through them

GRAPE JUICE CONCENTRATED

According to a report of the Department of Agriculture a unique method of concentrating grape juice has been discovered in the government labora-The process is considered a tories. most important one for the wine indus-

try, and among other things provides a way improve vintages made from cheap, coarse varieties of grapes. In concentrating it by the new method the juice is first frozen, and the resulting ice crushed into fine pieces and placed in a machine, which by centrifugal force causes the sirup and sugar to be separated from the water. A gallon of liquid is in this way reduced to about a quart of thick sirup, which retains to a remarkable degree the original color of the grapes. The acidity of the juice is also lessened materially, for the cream of tartar is crystallized Subse-

ACCURATE HEAT TREATMENT IN ROTARY FURNACE

To secure a dependable and uniformly tempered steel spring is a troublesome process, particularly with the older types of steel furnaces with their drafty doors and generally uncertain action. One of the chief difficulties, according to furnace men, is to keep the temperature controlled accurately, and to prevent undesired materials from the furnace itself from combining with the steel during the tempering Sec. 28 35 3.

period. Then, too, the older types of furnaces, besides turning out a product of uncertain composition, present difficulties from a manual viewpoint-it is too hard to get materials into and out of the devices while in action, resulting in limited production.

A new furnace has recently been put in action at the plant of a Detroit company, which is expected to eliminate many of these defects and to turn

Detroit Steel Produ

The Rotary Furnace in the Background Heats Automobile Springs Uniformly and Delivers Them at the Proper Temperature for the Oil-Tempering Baths

out products with an accuracy and speed never before obtained. Its specialty is the heat treating of automobile springs. Men place the leaves, or overlapping flat strips, of the typical automobile spring on the hearth at one point, and the whole apparatus turns about a central axis, delivering the leaves to another set of men farther on. hot oil fires within the furnace having in the meanwhile raised the leaves to a predetermined temperature. usually ranges from 1,450 to 1,575° F., depending upon the particular requirements of a given kind of spring, and 10 electrical pyrometers—that is, thermometers capable of registering high temperatures with the aid of electricity enable accurate check to be kept on the hotness of the springs at all times. Seven men are required to operate the furnace, and it can turn out 50,000 lb. of steel per day, said to be four times the capacity of the ordinary furnace of the kind. The hearth is 26 ft. in diameter, and revolves once every 20 or 30 minutes.

CApproximately 3,000 volumes have been contributed toward the reconstruction of the Louvain University library.

MAKING NEW ANODES FROM 7 9 SCRAP NICKEL

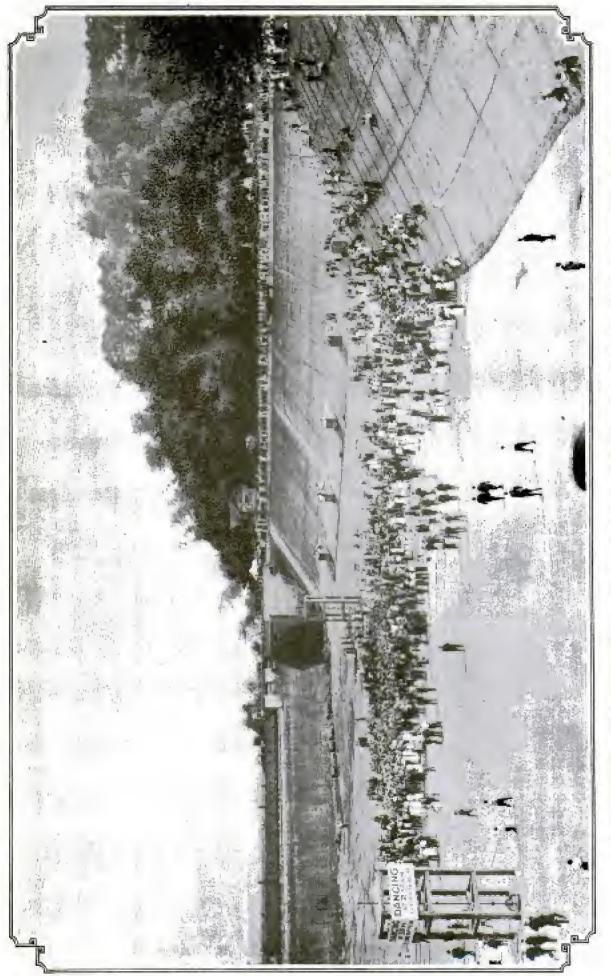

By using the oxyacetylene flame to weld together the pieces of worn-out

nickel anodes, have which heretofore been scrapped and sold at less than half the cost of the new material, one company is now producing practically new anodes at a triffing cost, As the anodes are caten away by the solution they are turned over to an oxyacetylene welder who

"tacks" them together, using from two to four pieces, depending on the size and weight of the anode desired. The flame is also employed in removing the brast hooks used for supporting the anode while in the solution. No flux is necessary in the process, and the only new material used is a piece of nickel that serves as a filling rod.

UNUSED RESERVOIR SERVES - いっしょ AS DANCE HALL

The leading feature of a municipal picnic given by a city in Ohio was a dance in which the basin of an unused water reservoir was pressed into service as a dance hall. The concrete floor served admirably for the purpose and furnished all the space needed by the hundreds of dancers who availed themselves of the novel privilege. The music was supplied by a brass band which occupied a temporary stand erected in the middle of the reservoir.

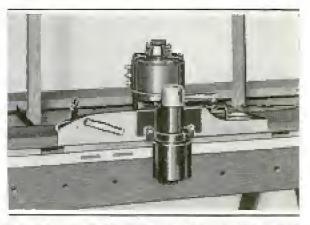

LARGE TRIANGLES ARE USED

During the past summer triangles of nucommon size were employed by engineers in making a survey of the western Canadian boundary line between Queen Charlotte Sound and Prince Rupert. In one case a distance of 135 miles was measured by this method, the work being done at night with the aid of powerful lights which were used to identify the distant point to be sighted. The transit was placed on a mountain at a sufficient height to overcome the earth's curvature and escape intervening obstructions. The accomplishment is interesting, not because it is unique, but because it is unusual. The geodesist has worked with triangles having sides 200 miles in length. An instance of this was recorded some years ago when a survey was made across the Mediterranean between Spain and Africa.

APPARATUS FOR FITTING DOORS

The elimination of the uncertainty and loss of time usually involved in fitting a door to its opening is the purpose of a new door-fitting apparatus that has made its appearance on the market. This apparatus consists of two parts, a frame and an electric cutting machine. The frame is made with sliding joints so that it can be adjusted to any size. It is simply placed in the

door opening, and when adjusted to a fit the joints are tightened. The frame is then laid and fastened over the door

How the Cutting Machine is Used in Connection with the Adjustable Frame to Cut the Door to the Right Size to Fit the Door Opening

to be fitted and the cutting machine is brought into service. This machine is equipped with a guide that works against the edge of the frame so that the door is cut down the right amount to make it correspond to the frame. By means of an adjustment controlled by a lever, any desired bevel can be cut.

BALLOONED MOTOR-CAR TUBE RESEMBLES HUGE SAUSAGE

For local advertising purposes a motor-car tire dealer at Morgantown, W.

Va., recently ballooned an inner tube to quite an enormous size. The distortion was effected by stretching and weakening the walls of the tubing: a thing which required time and considerable patience. Subsequently a coat of red paint was applied, giving it the appearance of a great

wiener wurst. This had an injurious effect upon the rubber, causing it to deteriorate and the tubing to burst after several days.

POPULAR MECHANICS

603 INTERLOCKING ACTION

A new semaphore for the regulation of street traffic has recently been tried out in eastern cities. A policeman operates the device in

Solid Comfort Provided Eastern Policemen Regulating Traffic Congestion at Street Corners

E company

In its ordinary form the contrivance is built on a pole, and consists principally g of two pairs of semaphore arms at right angles to each other. These are controlled by interlocked levers on the lower part of the pole. Because of the interlocking, a policeman cannot give both streets at an intersection the clear signal at one time. A sheltering umbrella is provided for hot summer weather or rainy days, and a platform and seat conduce greatly to the officer's comfort. At night the machine shows a red and green light in addition to the "Stop" and "Proceed" positions of the semaphore arms. A gong automatically gives forth signals corresponding to the usual one or two blasts of a traific policeman's whistle. Much superiority to the unaided policeman is claimed for the device, permitting crowds to be handled more promptly and with less chance of misunderstanding. The unmistakable character of the signals is one reason for this.

ANCIENT PORCELAIN FACTORY 70 GREOPENED IN CHINA

The famous King Teh Cheng porcelain factory, which from the year 1396 furnished all the fine porcelain for the royal palaces of China, is to be reopened immediately, according to a Chinese newspaper, and a grant of \$20,000 has

> already been made by the president of the republic for this purpose. This factory was partly destroyed during the revolution in which the republic was established and the various samples and patterns kept there were divided among the leading revolutionists. While the making of porcelain has been one of the leading Chinese industries for generations, this factory is said to be the only place in which the ancient ways of making porcelain, with the beautiful

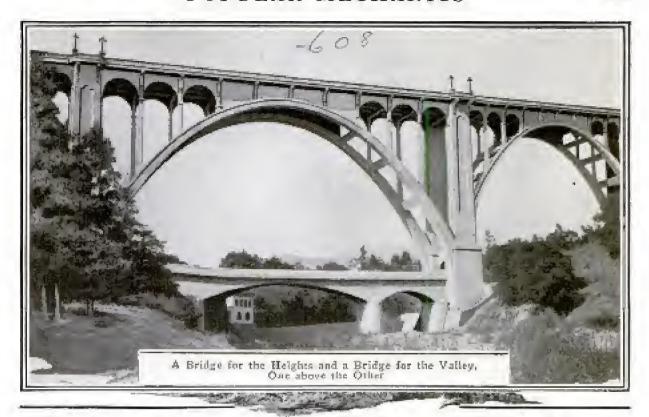

ancient colors and designs, has been preserved. The factory will not only be employed in producing porcelain for the market, but will have a special department in which porcelain of the highest quality will be made for presentation to the rulers of other countries.

A BRIDGE WITHIN A BRIDGE SPANS WESTERN RIVER

The Arroyo Seco is a small California stream, but the valley through which it flows is wide and the surrounding hillsides are steep and difficult to climb. The main automobile roadway between Pasadena and Los Angeles had to cross the stream, but motorists objected to descending into the valley, only to be met after crossing the wide bottom of the basin, with a sharp ascent on the other side. So a large bridge was constructed, spanning the whole valley, and giving a level speedway over what was formerly

Chas alma Byers

Copyrighted material

a difficult stretch of country. But this left the residents of the valley in an unusual predicament. To cross the river, they were confronted with the necessity of climbing the steep hills back of their homes in order to get onto the high bridge, and then, after getting to the other side, a corresponding descent had to be made. So, for their benefit, a second bridge was built directly under the first one, and even between its high piers. The result was a "bridge within a bridge," and neither of them very small structures. Both are of concrete, and together are said to have cost in the neighborhood of a quarter of a million dollars.

REFUSE COLLECTOR BUILT 45/ IN KITCHEN SINK

Quite an interesting departure from the standard plan of kitchen-sink construction has been marked by the incorporation of a refuse trap as an integral part of the drain system. This idea has been developed by a western inventor who has provided a depression in which a strainer pail is countersunk. The waste pipe connects with this. The refuse collector is made of

white enamel and fits snugly in place, becoming a part of the sink. Dishes may be rinsed and cooking utensils scraped in the sink without danger of clogging it, for the sieve in this case is fine meshed. A bail is attached to the strainer to facilitate its removal when it is wished to empty its contents. Another convenient feature of the new sink is the presence of drawers and a roomy closet, which are provided beneath both ends of it.

ELECTRIC SAND SIFTER THAT OUTWORKS TEN MEN

Many modern foundries are being equipped with electric sand sifters, or what foundrymen call "riddles." For

This Electric Sand Sifter is Suspended upon a Trolley and may be Moved Anywhere about a Plant

this innovation several advantages are claimed. Among these claims is the assertion that it will do the work of 10 men using older methods, and that the machine is much easier handled. The mechanism of the new riddle imparts to the sieve a gyratory motion, cleaning and sifting the sand as fast as it is poured in. Only a small motor is required to operate this new sifter, \(\frac{1}{16}\) hp. being the usual size. A trolley permits its easy transportation.

BOSTON'S NEW BALL PARK

Permanency in construction and convenience in arrangement are two of the outstanding features of the Boston Braves' new home, which is credited as being the finest baseball park in America. The grand stand and main bleachers, providing seating space for about 37,000 persons, as well as the administration building and other appurtenances, are built of steel

and reinforced concrete.

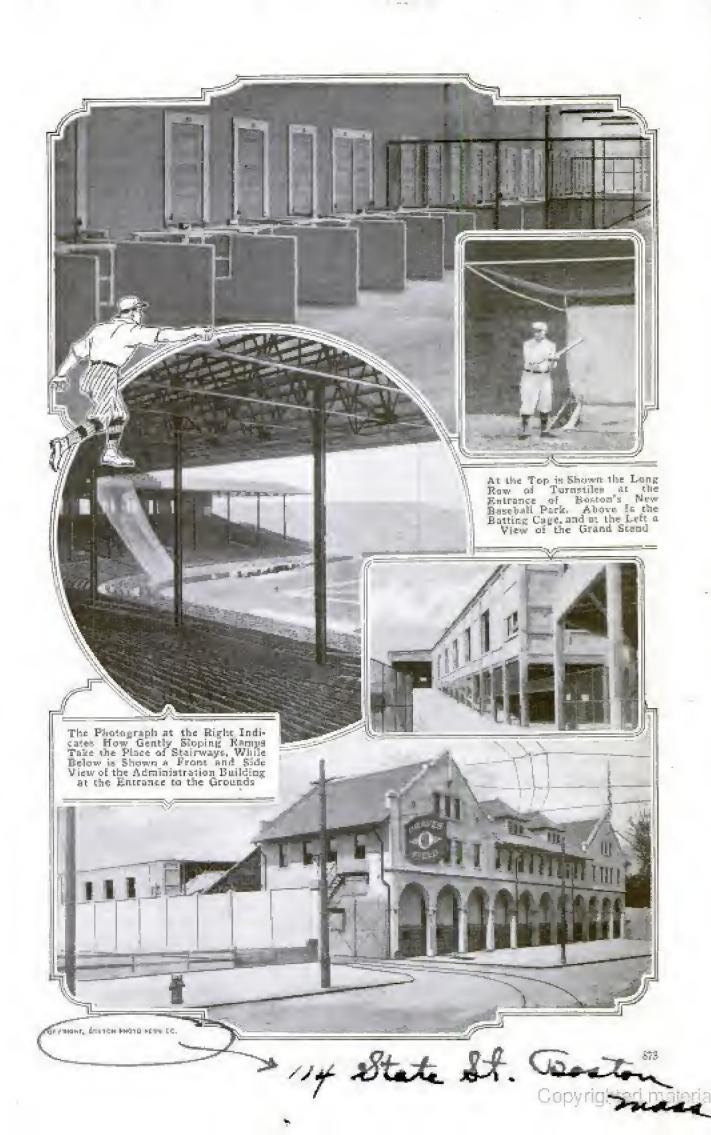

The field is depressed 17 ft, below the street level, and is provided with a complete drainage system. It is surrounded by a 10-ft, wall, and extends 520 ft. in a straight line from the home. plate, which is 60 ft, from the central part of the grand stand. The foul lines running from this same point are carried out to a distance of 375 ft. on each side. The low level of the diamond has made it possible for twothirds of the grand stand and bleacher structures to be built solidly on the ground, which materially lessens the climb from the outside to the top tier of seats. All of the 18,000 seats in the grand stand consist of comfortable armeltairs. There are 37 rows of these, spaced to provide plenty of room for their occupants. On the roof of the grand stand, which is supported by steel columns and trusses, are located the press boxes, a writing room for correspondents, and a room for their telegraphers. The grand stand is of heavy construction and has been designed eventually to support a gallery, should the present capacity prove in- . adequate.

A tunnel gives access to the home bench behind third base. The club-houses for the players are situated beneath the grand stand and are fitted with the usual accommodations. There is a total absence of stairways at the park, all of the elevations being reached by concrete ramps. Trackage for about 42 cars is provided within the grounds, and is reached by inclines from the various sections of seats. At the park entrance there is a row of 28 concrete

stalls, in each of which is a turnstile. Past this point the passageways leading to the various sections of the grand stand and bleachers are inclosed by fences of iron netting. The ticket booths are situated within large concrete columns immediately back of the arcade extending along the front of the administration building.

HOUSEKEEPING MECHANICS TAUGHT IN MODEL SCHOOL

That the young women of Hollywood, Cal., may be instructed intelligently in various important branches of housekeeping which ordinarily re-

The Metal-Working Class at the Hollywood High School: Here the Young Women are being Shown the Inside of a Water Heater and Instructed in How to Repair It

ceive little or no attention in domesticscience classes, a high-school course has been inaugurated. The many mechanical devices which have been developed for lightening housework are dismantled and their principles explained. The purpose is not to make master plumbers of the girls, but so to equip them that if necessity demands it they may be able to fix a leaky faucet, repair a defective gas range, take proper care of a sewing machine or vacuum cleaner, and know instantly how to do or direct work of similar character which continually presents itself in every modern household.

Every-day problems of almost every kind are considered in the course of instruction. A part of the school is finished off like a bungalow, and here each girl not only learns to cook and sew, but is taught to arrange furniture artistically, serve daintily a dinner or luncheon to a number of guests, and provide an evening's entertainment in accordance with her own ideas. Economical purchasing is an important feature of the training. Trips are made to the municipal market, where the art of getting good values is taught. In this the average wage-earner's income is taken as a basis.

TRAINS PROTECTED AGAINST BULLETS BY STEEL FENCE

Along a Canadian railroad that passes the end of a rifle range it has been found necessary to build a solid steel fence to protect the trains from stray bullets. The railroad is located near the top of a high and precipitous hill. Since it is about 150 ft. above the rifle range and is at a considerable distance from the firing station, there was thought at first to be no danger from When the railroad had been in operation a short time several bullets went through the windows of a train, narrowly missing some of the passengers, and the steel fence was then built. The fence is as long as the range is wide and extends well above the tops of the cars. It is supported on steel rails driven into the hill under the track.

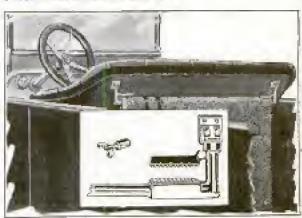

The Ice-Breaking Tug "Sylvia" Opening a Way through the Ice in Green Bay. The Guils have been Attracted by the Opportunity for a Dip in the Channel Made by the Tug

POWERFUL TUG BREAKS ICE 9687 FOR FISHING FLEET

Connected with the fishing fleet that operates in Green Bay, on the western side of Lake Michigan, is the "Sylvia," an ice-breaking tug that is said to be the most powerful in the world of its size. This tug is the subject of a wager that has been open for years but has never been taken. The bet offered is \$100 to 50 cents that no tug of the same size affoat is able to equal the "Sylvia" in ice-breaking feats. The "Sylvia" is 60 ft. long and 15 ft. wide, and has succeeded in breaking up the ice in the bay winter after winter when other and larger boats have failed.

₩3/ —— MOTOR-CAR ROBE BRACKET WITH LOCKING JAWS

For use in the tonneau of a motor car, a robe rail has been devised which has movable jaws between which coats and wraps may be locked securely and left unguarded without danger of being faced with pyramid rubber so that they hold firmly and do not injure a garment. They are controlled separately by an individual key, a few turns of which serve to open or close them. The two outer, or stationary, jaws are designed so that they support the rod. When robes or articles of apparel are left in a car, locked in this manner, they cannot be taken away unless the thief steals machine and all.

ILLUMINE STEAMERS' SIDES

Neutral ships entering the so-called "war zone" carry their names and ports of registry displayed in large letters on their sides. In order that these signs may be distinguished at night by commanders of belligerent battleships and submarines, they are illuminated. Many of the small freight steamers at present engaged in the transatlantic

recent change to electric systems. These searchlights are mounted on arms, extended from the sides of the ships, and adjusted so that their shafts of light play over the banners.

PROPERTIES OF PLATINUM ARE STUDIED BY EXPERTS

684-

Though more valuable than gold and greatly used in the arts and sciences, there have been many things about

platinum not fully known or understood. Particularly is this true of the metal's precise physical and chemical properties. The United States Bureau of Standards recently undertook to investigate these things, and some interesting developments were a result.

One accomplishment of the bureau was the invention of a delicate thermoelectric test for the purity of platinum. By its aid a rapid estimate of the amount of foreign matter in the metal, such as iridium or iron, may be made and without injuring the metal in any way. Large purchasers of platinum ware are said to be using this test extensively. The bureau also obtained data by which it is now possible. to predict accurately what will be the loss in weight of a platinum

service are not equipped with electriclighting facilities, which has made it necessary for them to be provided with auxiliary systems for the illumination of their sides. This has led to the adoption in many instances of motorcar lighting equipment; powerful acetylene headlights supplied with gas from high-pressure tanks such as were almost exclusively used before the crucible when heated, thus enabling certain tests in analytical chemistry to be made more exact than formerly.

GFor the 12 months ended August 31, 1915, the exports from the United States aggregated \$3,035,033,280, an increase of \$754,847,489 over the exports for the corresponding next-preceding period.

RAILWAY-CROSSING GATES ₩53 BARRICADE TRACKS

In an attempt to devise a crossing guard which will effectively hold back motor cars in cases of extreme emergency, an eastern railway company has made use of two 40-ft, spruce piles. These members, which serve as arms for the gate, are about a foot in diameter at the base and 8 in, thick at the They are supported between posts by means of 1-in, bolts and are counterbalanced with 1,000-lb. weights. Fixed to the tip of each pole is a rope with which a gate is drawn down by a watchman, who then secures it by means of a large hook and chain. When the gate is lowered it is 3 it. 6 in. from the crown of the roadway. At this height the poles are in a position to stop a motor car which has failed to heed the flagman's warning. The arms are painted with black and white spiral stripes.

MUSIC STILL PRINTED FROM "PUNCHED PLATES"

For more than a quarter of a century the method of making the original plates from which music is printed has remained practically unaltered. is more or less interesting in view of the material changes which have marked the development of the general printing and engraving processes during the same period.

With the exception of the method ordinarily used in printing hymn' books, in which each character is reproduced from a separate piece of type, the first step in the process entails the making of a "punched plate." This is the original negative, and is made today essentially the same as it was years ago. The plate itself is a composition of lead and zinc. The staff lines are cut into it with a ruling pen, after which the impressions of the various notes and marks are made by hand with punches.

When a large run is to be made by the publisher, a zinc etching is usu-

resent some particular kind of wood. One of the advantages claimed for this material is that it can be put in place without difficulty by any paper hanger. The material comes flat, but is scored so that it is easily bent into the shape of a beam. When the beams are in place they are 4 in, square in section with a molding I in, square in the angles. The location of the beams is first laid out on the ceiling with chalk. The beams are bent into shape along the score marks and are then attached to the ceiling by means of screws driven through the top side of the

molding into the lath. Following this, the outside of the molding is bent down into position, and the lower part is pasted to the side of the beam, the parts being held together by wire loops while the paste is setting. For joining two sections, a core box made of the same material and designed to fit accurately into the beam is used, while a junction with the side of another beam is made by cutting the material to an accurate fit. When the beams have been in place long enough for the paste to set they are covered with the paper veneer.

NEW SOLDER FOR WELDING

There has just been placed on the market a new kind of aluminum solder that is likely to prove of the greatest value in connection with auto-/ mobiles, aeroplanes, and other lines 🗐 which aluminum is used extensively, since it does away with the usual tedious processes of welding broken, aluminum parts. No soldering iron is used with this material. It melts at a comparatively low temperature and all § that is necessary for applying it is a gasoline torch. It can be used not p only for straight welding but for building in lugs and broken-out aluminum A sections from such parts as crank s cases and manifold pipes. The superstructure, which is mounted on heavy wagon wheels, is designed much like a small bungalow and is about 12 feet by 15 feet in floor dimensions. During the daytime it is kept on a vacant lot in the middle of the business section of the city. It is neat and clean in appearance and provides sufficient room for the seating of more than a dozen patrons at one time.

MUNICIPAL MILK STATION PLANNED FOR NUREMBERG

In an aftempt to deal with the milk situation at Nuremberg, Germany, the municipal authorities have approved the development of a permanent distributing station to be established as a limited-liability company. A trifle less than one-half of the capital is to be subscribed by the city, while dividends to stockholders are to be limited to a maximum of four per cent. This plan is to be undertaken so that milk may be obtained from a dependable source and at reasonable prices.

VALUABLE OIL IS TRAPPED

The supply of crude oil coming from the Kansas and Oklahoma fields is said to be falling off, due, according to experts, to the gradual draining of great pools of the liquid which formerly underlaid those states, far beneath the prairie surface. Because of the diminishing supply, the amount available has had to be economized to a greater

degree than formerly.

In other days oil from a newly bored well would generally be permitted to spurt out unchecked for a long period, flowing away on the surface of some near-by stream. Then, too, an occasional bursting oil tank would contribute its quota. As a means for saving this wasted oil, which of course floats on the surface of the water, oil men have taken to throwing out wooden booms over the surface, which shunt the oil off into pits dug in the banks of the stream. From the pits, the oil is pumped to storage tanks with gasoline engines. It is estimated that each of the traps so set up has caught, on an average, \$1,000 worth of oil per month. The oil is of inferior quality, however, due to the exposure and admixture of water.

610-BURROS AID IN MARKETING HUGE TIMBER RESERVES

As a natural consequence of having acquired millions of acres of the finest timber lands in the world, the national government has necessarily had to go into the lumber business. The sales of timber from the national forests of Colorado have increased year by year, and supplying ties to railroads forms no small part of the government's lumber business, which is conducted

up in the mountains and hard to get to market.

Pack mules have had to be used in some cases in order to get the big sticks safely down the steep trails. A tie is strapped on either side of the little burros, and they march off in single file, dragging one end of the sticks on the ground. After reaching railroad or mill, the ties are piled up and each is marked by the watchful forest rangers, part of whose duties it is to see that the government stamp is on every tie that goes out of the forest.

587 ICE-BREAKING CAR FERRY HAS PASSENGER QUARTERS

The "Prince Edward Island," an iccbreaking steamer recently built in England for service in the Straits of Northumberland, Canada, is a craft of unusual type, since it is designed not only to do the work of an ice breaker but that of a car ferry and a ferry for passenger, and other miscellaneous, traffic as well. The straits separate Prince Edward Island from the mainland of New Brunswick and Nova Scotia, and like most of the waterways in this latitude are iccbound during the greater part of the long winter.

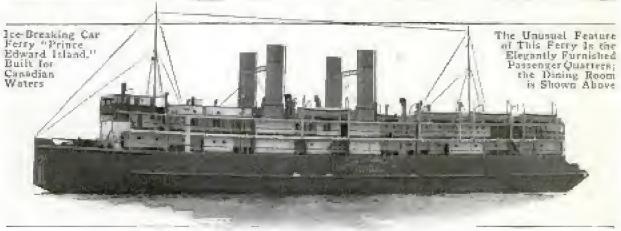

through the Forest Service. But much of the material available for ties is far

POPULAR MECHANICS Expland

At the narrow point in the straits, where the boat is to operate, the distance from the mainland to Prince Edward Island is about nine miles. With a clear channel the passage is made in about 40 minutes, but with the channel clogged with ice the passage may require several hours. On account of this the passenger quarters include a dining room and are comfortably and elegantly furnished throughout. The vessel is \$85 ft. long, and has a mean draft of 18 ft., while the propelling ma-

chinery is capable of developing 7,000 hp. The load carried by the vessel, including coal, is about 650 tons. The bow is so shaped that it splits the ice and rides it down at the same time. One of the novel features of the craft is a propeller placed at the bow. This propeller is used not only in backing into the dock, but is a valuable aid in the work of breaking up the ice, since it draws some of the water from beneath the ice and thus weakens its support.

One leg of each of the units is bent to form two loops, one located near the top of the fence and the other at the ground line. In erecting the fence the sections are driven into the ground successively, the straight leg of each section being first passed through the loops of the adjacent section.

AUTOMOBILES GET BUSINESS OF STEAMSHIP LINES

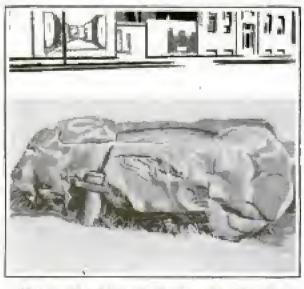

A steamship line in the excursion business on the northwestern coast found itself in an unusual predicament lately. The company started its scason brilliantly by opening a number of resort places along the rivers and coast. For a time all went well. Then traffic

commenced to fall off, and stop after stop had to be abandoned.

An investigation revealed the cause. It was found that after the steamship company had popularized its resorts, most of the people who visited them came in automobiles. This was not at all satisfactory to the steamer people, as they had looked to passenger fares for their main returns. The company therefore concluded not to promote any places accessible to automobiles, and hereafter will plant all its summer colonies on islands, securely out of reach of four-wheeled rivals.

THE WAR'S INFLUENCE ON AMERICAN TOYS

695

By SEARLE HENDEE

POLITICAL conditions and social changes have for centuries reflected themselves in children's toys and games, just as they have influenced the dress, art, and literature of nations. It is not surprising therefore that this year the American boy's Christmas playthings bear conspicuously the stamp of Europe's conflict. A greater variety of military and naval toys is now afforded than ever before, both because of the status of affairs abroad and the striking changes in modern warfare and its instruments of destruction.

There is hardly a new war tool of importance which has not to some degree furnished a pattern for a child's bauble. A miniature battleship unequipped with wireless aerials or a complement of flying boats cannot be called modern. The air rifle which is without a blunted bayonet and a shoulder sling is obviously not designed for mimic hostilities. A cannon which fires only one wooden projectile at a time is at a disadvantage, for quickfire and machine guns are now used in bombarding pasteboard forts and combating pigmy soldiers. These individuals have also undergone a radical change. They have developed into animated dolls fully attired in field uniforms and fitted with haversacks, cartridge belts, and rifles. They walk about with military pomp and clatter, instead of remaining quietly in the places they are set.

Thus the toy makers of both the old world and of America, who are the ordnance manufacturers for the youngsters' military forces, have kept astride with the Krupp, Schneider, and Bethlehem designers. Regardless of whether battles are fought from the bomb-proofed trenches in France. across a parlor floor, or in a bathtub, the exigencies of war are met with the latest implements. A few years ago a boy built his fort with blocks, inserted pencils in loopholes to serve as guns, and provided the "booms"

with his own lungs. The contrast between the war equipments of that lad and the boy of today is just as great as that of the fighting tools used in the Rebellion and those employed There are elaborate papiermaché fortifications with disappearing guns that operate electrically and flash when they discharge. These may be fitted with toy radio plants and connected by electric railways over which troops and munitions can be transported from different parts of a room. If a boy's soldiers are attacking a fort, they have artillery batteries to cover their advance and siege guns to batter

the stronghold.

One of the most ingenious toys of American manufacture inspired by the European war is a machine gun. This is mounted on a tripod, is 22 in. long, and has a businesslike appearance. The ammunition consists of wooden projectiles slightly less than two inches in length. Slots in these members allow them to be fitted onto a tape, which is passed over the barrel in front of a firing pin and attached to a reel. A crank at the rear controls the latter, and as it is turned the tape is wound, each revolution drawing a bullet into position and actuating a hammer which fires it. The gun may be shot in this manner a hundred times without reloading. As it is being fired, the barrel spitting out bullets in rapid succession, the gun may be sighted at different torgets, or trained at a single object, as the operator deems expedient.

A play army equipped with a machine gun, but unprovided with fast artillery batteries, would be seriously handicapped. So a breech-loading, quick-fire gun has been developed. The mechanism of this is somewhat similar to that of the weapon just described, although its appearance is much different. It has a range of about 20 feet and may be fired at the rate of approximately 10 shots in three seconds. The ammunition, consisting of wooden projectiles, is held in a magazine fixed at the top of a loading chamber. The bottom builet rests in a slot at the rear of the barrel in firing position. A cylindrical block, fitted back of the loading chamber, is turned by a crank. Inside of it is a coil spring which is alternately compressed and released, forcing a firing pin against each shell in turn with considerable force.

The quick-fire gun is not of the mobile type, but instead is provided with a stationary mounting. A long-range field gun, however, which is similar in lines to some of the types used by the French and British artillery forces, has been produced. It is made entirely of metal, is mounted on wheels 6 in. in diameter, and has a barrel about a foot in length. With it is a mechanical soldier in uniform which lifts one end of the trail and draws the cannon along as he walks. The piece loads at the muzzle and fires wooden projectiles by means of a spring mechanism. It is fitted with a shield and is painted a war gray.

Another field gun, much smaller in size, is very similar in appearance to the famous French "75". It is provided with a slanting shield, while a recoil cylinder is attached beneath the barrel. Paper wads or rice kernels may be used as ammunition. For heavy work a wooden mortar which drops solid-rubber cannon balls on an enemy's fortifications is a part of the

child's ordnance.

In the mind of a wide-awake child commander, a detachment of makebelieve troops is no more immune to the effect of an enemy's fire than are flesh and blood men. The toy soldier now faces in the miniature many of the same engines of destruction as does his human prototype. If he is to make attacks against quick-fire and machinegun batteries, he requires adequate deiense. Therefore armored motor cars of different types have been placed at his service. Some of these resemble very closely the heavy, formidable vehicles of Europe's battle fields. One model, imported from England, looks much like an American-built car which

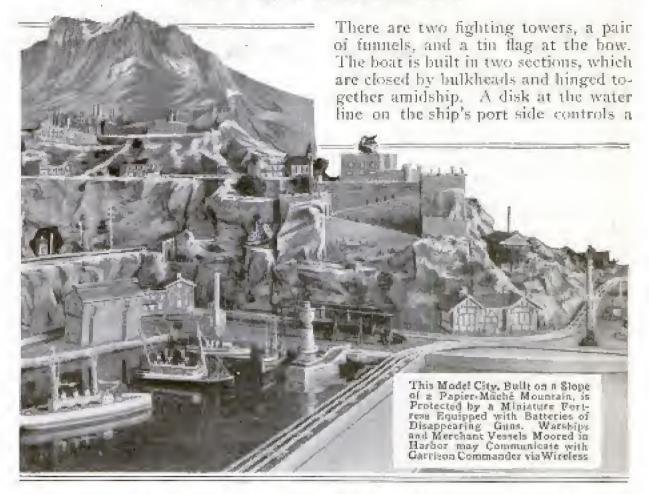

is being used by the allies. It is painted a war gray, has portholes for observation as well as rifle purposes, and mounts a light gun on a shield-protected turret. Inside of the car are two dolls, one a chauffeur sitting at the steering wheel, the other a gunner standing back of the turret. Metal doors in the sides of the body provide means of entrance and exit. An extra tire is carried at the rear, and the machine is propelled by clockwork.

For defense against aerial attacks an anti-aircraft gun has been designed. This is of the high-angle type and is mounted on the chassis of a toy motor car. It may be turned vertically or horizontally to any position. Anumunition is carried in a caisson immediately back of the driver's seat. The

car is driven mechanically.

With all of these death-dealing implements, hospital and ambulance provisions are needed. So a motor-car ambulance for field service has been designed by an American maker, power plant of this car, which consists of clockwork, is mounted under the hood, while a driving shaft extends to the rear axle. A small crank is used at the front in winding the motor. A stretcher of diminutive size is provided, Every army must have its field hospital, and, in addition to ambulances, surgeons and nurses, wounded soldiers, tents, and Red Cross flags are available so that proper care may be taken of those who fall in the bloodless parlor-floor battles.

During the winter mouths when it is not especially pleasant to play around a garden lagoon, naval battles must be waged indoors. This contingency has been looked after so that snow and ice need not interfere with an embryonic admiral's campaign plans. A large dark-blue rug forms a very good ocean for submarine attacks upon a dreadnaught, which is now provided. Both the ship and the toy undersea craft are made of wood and finished in war color. The latter has a hole in its bow which serves as a torpedo tube and allows a cylindrical wooden missile to be fired with considerable force by means of

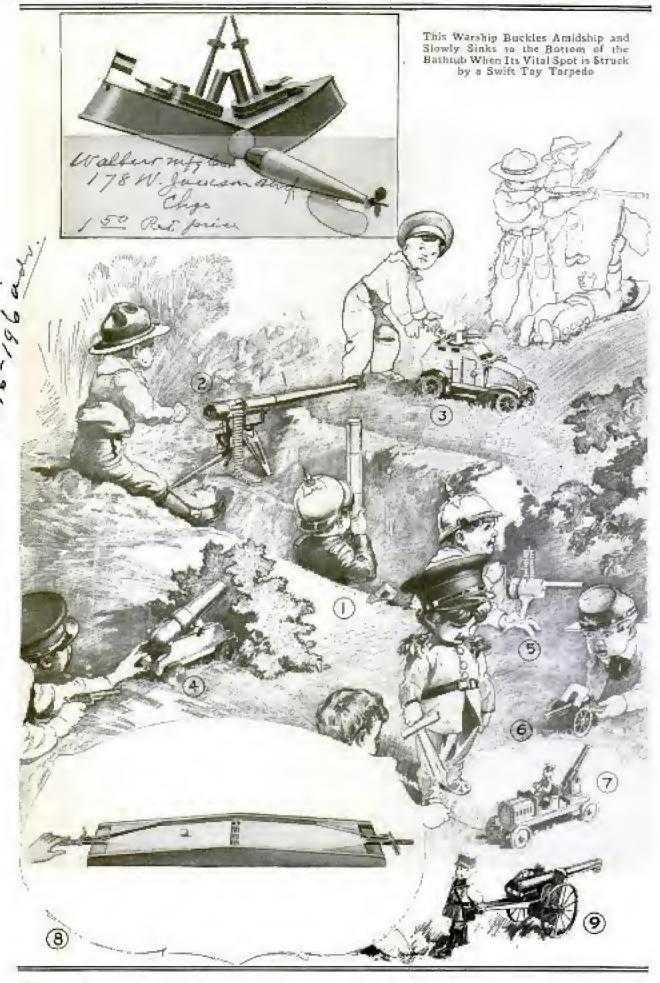

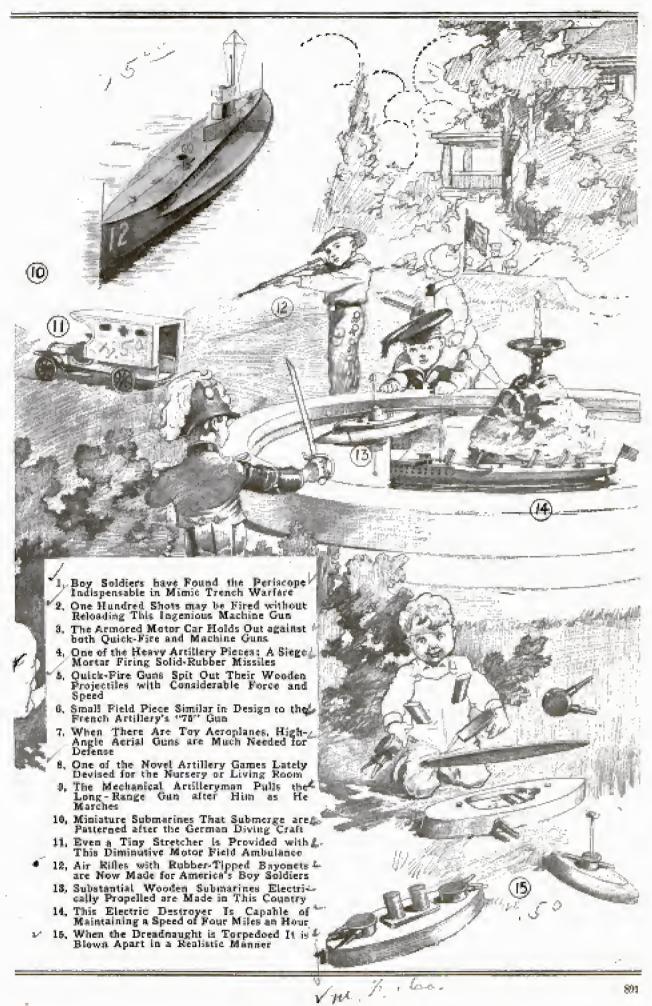

a spring gun. The mechanism is contained inside of the craft and operated by a lever which extends through the conning tower. The dreadnaught is made with its deck, gun turrets, and funnels as separate pieces which fit in place. On the interior is a spring device similar to a mouse trap. When this is sprung, the dreadnaught is blown apart. A plunger, to which is attached a small red disk placed amidship on the starboard side, controls the spring. By launching a projectile from the submarine and striking this vital spot, the larger vessel is torpedoed and to all purposes destroyed.

For the young tar who spurns a bluerug sea and insists upon fighting naval battles on real water, a similar game has been devised which is quite well adapted for either bathtub or swimming-tank purposes. It consists of a metal warship and a wooden torpedo, which when in action allow a child's imagination to carry him as far as be desires. The vessel has a complement of eight gans mounted in four turrets. catch, which when released allows the boat to collapse. Water then rushes into the two compartments through holes in the upper part of each bulk-head, while the air is forced out through portholes at both the bow and stern. After a few seconds the battle-ship sinks. The torpedo is of the usual shape and is provided with a hand motor and propeller which carry it through the water quite rapidly. If the missile is accurately aimed, a large rudder fixed to it steers it straight for the ship's vital spot.

When the toy soldiers are cast aside and their commander becomes a mere private or petty officer in the neighborhood army, more mannish tools than these are required. A periscope is one of the instruments now available in the gewgaw world which has been directly inspired by the European war. Indian fighting, of course, doesn't require trenches and periscopes, but when the real war game is on, the average small boy has learned that bomb-proofed intrenchments are quite neces-

Podis

sary. And with these strongholds, periscopes made of tin and fitted with mirrors, are quite important accessories. They are made in tubular form and have angular reflectors at each end.

The latest gun for outdoor use is distinctly of a military type. It is an air rifle equipped with a rubber-tipped bayonet and web sling. It has an overall length of 38 in, and is comparatively light in weight, so that it is good for drilling purposes and skirmish work.

By far the most ingenious of the new war toys is a miniature replica of a German submarine, imported from that country. It is driven mechanically, and on the surface is capable of making a speed of four miles an hour. It is fitted with diving planes and, when set to do so, will submerge so that only the tip of its periscope is The diving is controlled autovisible. matically and after the boat has proceeded for a certain distance it will rise to the surface and then disappear again. after a short time. If its operator desires, the automatic control of the planes may be dispensed with and the craft sent either along the surface or beneath the water.

A domestic submarine has been modeled after the B-class boats of the United States Navy. It is 28 in, in length and is driven at a speed of about four miles an hour by an electric motor which is supplied with current by a dry cell carried within the craft. Diving planes are fixed near the stern, but these are purely ornamental, for the boat does not submerge past its normal water line. The propeller and rudder are made of aluminum, while the stuffing boxes, shafting, and deck rails are of bronze. A small gun is mounted in front of the coming tower.

Another unit for the child's navy, made in America, is a torpedo-boat destroyer patterned after the "Decatur," U. S. N. The upper works of this vessel are built low, while the armament consists of light guns mounted in two turrets, five rapid-fire guns, and two deck torpedo tubes. There are ventilator funnels, smokestacks, and

lifeboats on the deck. It is finished in war gray and driven electrically.

Both in this country and Europe a large number of war games have been developed during the last year. Abroad this industry has been materially stimulated by a great demand for amusement devices with which to entertain the wounded at various hospital bases. Many of these are patterned after chess, checkers, and pachisi, as well as other standard games, while some are quite new in all their details. American game which represents artillery work, is especially pleasing to The board on which it is children. played is rectangular, 26 in. in length and inclined from both ends toward the middle, or crest, which is designated as a hilliop. A groove extending across the board at this point serves as a trench and is divided into five numbered sections. At the bottom of each incline there is a spring lever, or gun, that shoots a marble. The player's skill is determined by his ability to place the marble in the division he desires, as a score of exactly 500 is required to win.

War chess is a German game which has become very popular at the military hospitals. It is played on a chessboard with two sets of men, each 12 in num-The contending figures are distinguished by their color, but from the front side are otherwise identical in appearance. On the reverse side, however, each member bears a number There are representing its value. "aviators," "scouts," a "king." and others, and it is the capture of the "king" which ends the game. A good memory and an exercise of strategy are required in playing creditably. In designing toys and games the Europeans have not escaped displaying considerable venom and hatred for their enemies. This is true even in playthings for young children. A picture puzzle shows a soldier killing a child.

These are a few of the scores of new baubles and games for both children and adults. In practically every instance they have been inspired by the European war.

Brite Agriculture MECHANICS

RAPID SPREAD OF THE BOLL

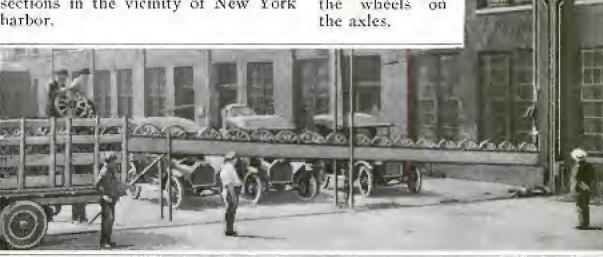

Owing to unusual conditions that prevailed in August, the most rapid movement ever made by the boll weevil when advancing into new country was made this year in the southeastern states. Ordinarily this insect advances at the rate of about 50 miles a year, but this year an advance of 100 miles was made in a period of only two weeks. This rapid movement carried the destructive insects for the first time into Georgia, where 25 counties became infested. During this period eight additional counties in Florida and 20 in Alabama were also invaded for the first time, the entire movement taking place between August 15 and August 31. One of the reasons for this rapid progress, as given by the Department of Agriculture, was the drought in Alabama, which deprived the insects of their usual food and forced them to seek a new district. The most important condition, however, was a series of extremely high winds that began on August 15 and blew continuously for several days toward the northeast, the insects being blown many times farther by the high winds than they could have traveled by natural flight, or with the aid of ordinary winds.

CSurveys are to be made in the immediate future for the preparation of military maps of Long Island and other sections in the vicinity of New York harbor.

AUTOMOBILE WHEELS ROLL SOTO THEIR CARS

One of the large problems in factories is to handle raw material and parts

with economy of time and labor. If this is not done, production costs rise, Many parts are quite unwieldy; not so in the case of wheels, however, as they may be rolled around far easier than carried. In a Detroit automobile plant wheels are unloaded from a truck into a narrow runway in the factory yard, down which they roll to an elevator on the outside of the building. Here fingers (313 endless chain grip each wheel and lift it to the top of the building, where it rolls along another runway to the men who put the wheels on the axles.

struction is made which may be adjusted to suit the requirements of different users. It consists of a lever held between two uprights and connected by a spring with a crossbar above. Notches cut in the under surface of the movable member and the top side of the crosspiece provide graduated spaces in which to place the

rings holding the spring, so that the tension may be varied as desired. The lever bar is secured to the rear upright by means of a hinge and moves in a groove extending through the front one. At the fore part of the apparatus is a rest which enables the wrist to be held in the correct position while different fingers are being exercised.

GARDEN AND TENNIS COURT

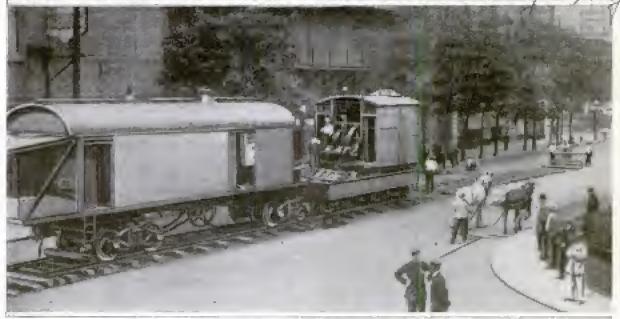

By taking advantage of a sidehill located at the rear of his residence, a builder of Salem, Mass., was able to build a garage the roof of which could be transformed into a garden and tennis court on the same level as the residence. The space for the garage was excavated out of the hill, which is about 18 ft. high. The structure is 38 by 77 ft., contains six compartments, and is built entirely of concrete. Part of the material excavated from the hill was placed on the roof and a garden and a tennis court of the regulation size were laid out. The tennis court has electric lights and is equipped with a wire netting that prevents the balls from going into the

How a Steam Crane and Steam Winch were Taken for a Distance of Three Miles through the Streets of Brooklyn

TAKING SUBWAY MACHINERY THROUGH CITY STREETS

A steam crane and a steam winch that are being used in subway construction in Brooklyn, N. Y., were taken under their own power through the streets for a distance of about three miles over something like 150 feet of temporary track, which was taken up behind the machines and built ahead as the machines progressed. A force of 25 laborers, with two foremen and a superintendent, were required for handling the track, and even with this force the rate of travel under the best conditions was less than a mile a day.

INSTRUMENT FOR FINDING A SHIP'S POSITION

Finding the true bearing of objects at sea as well as the position of a ship with reference to a coast line, without resort to computation or plotting, is made possible by a new attachment designed to be mounted on the binnacle hood and operated in connection with the ship's compass. The instrument consists of a sight tube carried on a revolving standard, to the lower end of which is fixed a curved arm terminating in a pointer. The standard

must be mounted accurately over the center of the compass. The pointer hangs close to the compass card, and since it swings with the sight tube it shows instantly the hearing of any object on which a sight is taken. The instrument is also provided with two graduated scales by which the distance to any fixed object, such as a lighthouse, may be quickly and accurately lound. This is accomplished by taking two bearings and noting the exact time that clapses between the two sights. The distance traveled by the ship during the interval is then estimated from

its known speed. The scales are so mounted on the bushing of the standard that when this distance is set off

ers, but it has remained for a Cincinnati firm to bring out a new variation. This contrivance has four small wheels about the size and general mechanical construction of those on roller skates. The front pair can be turned about an axis by proper manipulation of the handlebars above, and thus the vehicle is steered. A foot brake of simple construction enables the speed in coasting to be controlled, and a seat for enjoying the ride is also provided.

ENORMOUS "NUTCRACKER" TESTS BUILDING TILE

A device that resembled an enormous nuteracker was the means used at a building convention in Iowa to test and demonstrate the strength of hollow building tile. The handles of this nuteracker were two 15-in, steel I-beams, each 25 ft, long and weighing 54 lb. to the foot. The lower beam was imbedded in the ground while the upper one was hinged at one end, as shown in the illustration. At the free end of the upper beam a tilting platform was constructed so that an automobile could be run upon it. The tile to be tested was placed between the beams, 3 ft. from the hinge, so that the pressure on the tile was about eight times the weight of the automobile with a portion of the weight of the beam added. The tile stood the test without being damaged.

DENVER FIRE STATION IS HOUSED IN BUNGALOW

One of the prettiest hungalows in Denver houses hose wagons and fire

engines. When planning one of the newer stations, the board of safety decided to upset all prevailing ideas regarding fire-station architecture. Instead of conforming to timehonored plans and specifications, a building with a pergola and many of the embellishments of the modern bungalow was decided upon and built.

firemen stationed in the unusual house have carried the idea farther by surrounding the station with well-arranged flower beds, shrubbery, and a well-kept lawn.

There Is a Pleasing Contrast between This Denver Fire Station and the Type Usually Seen

MODEL LOCOMOTIVE BUILT

As an illustration of what boys can do in the field of mechanics under the tutelage of skilled workmen, a group of apprentices in the shops of an eastern railway company recently built

what is probably as complete a model of a Pacific-type locomotive as has ever been constructed by beginners.

This diminutive engine and tender, which are built on a scale of ¼ in, to the foot, have together an over-all length of 57 in, and rest upon a stone-ballasted 35%-in, gauge track.

The work was done from \(\frac{1}{16} \)-in, scale blueprints which were drawn by the boys and turned over to apprentice patternmakers as rapidly as they were completed. Before the work could progress very far, it was necessary for them to build much of their own machinery and equipment. This entailed the designing and construction of a lathe, shaper, and 1-hp, motor, besides the development of a machine shop, erecting plant, and foundry.

Needles were used in forming the pins for the valve gearing, for which hardened members were required, and rubber insulation stripped from copper wire was employed as air-brake hose. These and other ingenious substitutions were made by the boys, who frequently faced and solved perplexing

similar things, which under ordinary circumstances are very difficult to catch. Movie cameras universally have to be used on tripods, and this makes it

exceedingly difficult for an operator to follow a speeding, or irregularly flying, subject. The new attachment consists of a flexible shaft connected at ... one end to a hand crank that may be turned by an assistant. This obviates the necessity of using a tripod, for the operation of cranking is done practically without affecting the steadiness of the camera. It enables an operator to hold a machine up with its finder before his eyes and follow his subject just as easily as if he were using a pair of field glasses. A small spring motor may be used instead of a hand crank, if desired. This instrument fits compactly into a small case worn suspended from the operator's shoulders.

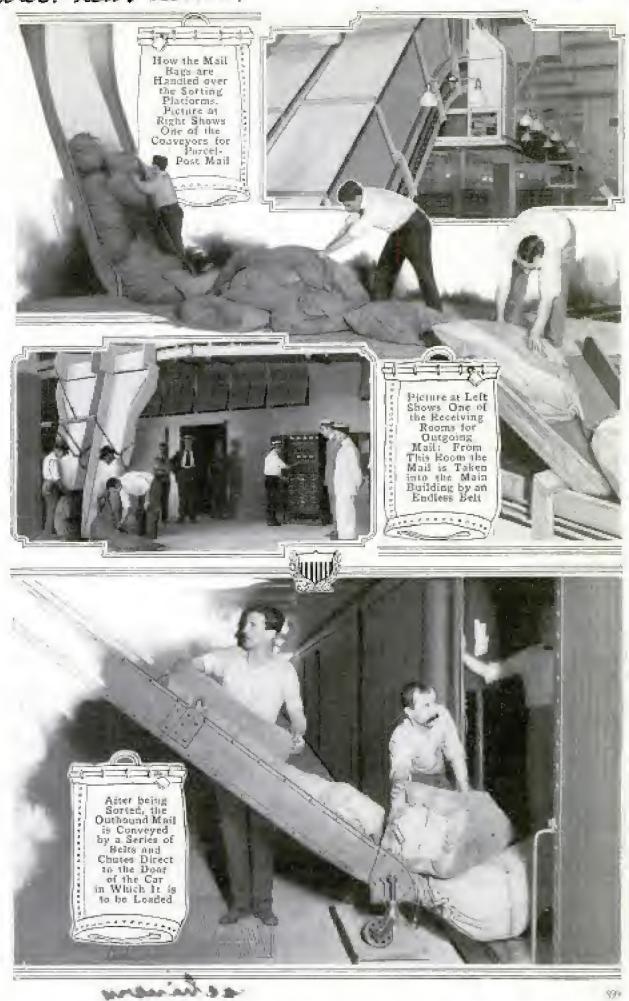

©Peru is experiencing hardships because of the shortage of small coins. Financial stringency in that country has caused individuals to hoard metal money, thus preventing its circulation.

NEW MECHANICAL PLANT FOR HANDLING MAIL

For sorting and forwarding the enormous quantities of mail going into and out of that city daily, there has just been placed in service in New York what is said to be the largest and best equipped mail-handling plant in the world. This establishment is known as the Grand Central Terminal Post Office Building. Although mail matter of all kinds will be passed through the establishment, its principal function is that of sorting and forwarding bulky mail, its construction having been brought about mainly through the importance of New York as a center for the publication of periodicals and through the growth of the parcel-post service. The most interesting feature is the system of mechanical conveyors with which the mail is taken into the building and then sorted and distributed for forwarding, without the aid of porters or trucks and without being touched by anyone except the sorters. With this equipment the establishment is capable of handling about 400 tons of mail a day. It is expected that the success of this establishment will bring about the construction of similar plants in other large cities for the handling of thirdclass mail and parcel-post matter.

The building occupies an entire city block and was erected and equipped at a cost of over \$1,000,000. In spite of the apparent intricacy of the carrier system it is made up mainly of three simple devices—endless belts for transporting the mail on a level, bucket lifts for raising it, and chutes for transferring it to a lower level. Coupled with these devices is a series of trips, electrically controlled by an operator working at a central station, with which the mail is diverted at various points in accordance with the route it is to take. One of the endless belts runs beneath the platform at which the outgoing mail is received. When a truck load of mail is received, the bags are dumped through hatchways in the platform and are carried by this belt

E. Leslie Gilliams, 116 Waverly Place, n.y. City Inter. news lervice

to a second belt that moves at right angles to it, and carries the mail into the building. From this point the mail that requires sorting is elevated by a bucket lift to the floor above and deposited on a third belt which runs the entire length of the big distributing room, while that which requires no sorting is diverted by trips and conveyed directly to doors of the mail cars. Two systems like this are provided for outgoing mail, one for handling second-class mail and the other for handling parcel-post matter. Underneath the building, located on each side of an island platform, are two tracks for mail cars, the two tracks together having a capacity of 33 cars. When the mail has been sorted and repacked it is placed on an endless belt and conveyed to chutes, through which it drops to a belt that runs along this platform. From this belt the bags are again diverted at the proper points and finally dropped down chutes to the car doors. Incoming mail is handled by a system similar to this, the bags being dropped from the mail cars through chutes to a belt underneath the platform, and then raised to the distributing room by bucket lifts. The belts are made of canvas and rubber, and are 3 it, wide. They work over rollers set close together in a steel trame and around drums at the ends, and travel at the rate of 150 ft, a minute. Electric power is used for operating the entire plant.

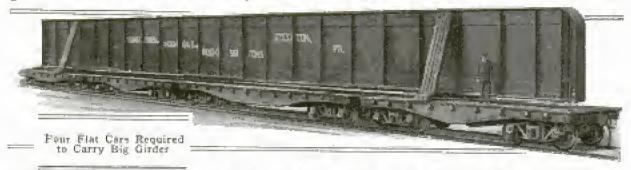

BRIDGE GIRDER OF UNUSUAL 545 LENGTH

A steel girder of such length that it was necessary to use four steel flat cars in shipping it was recently sent from the shops at Steelton, Pa., to Chicago, where it is to be used in a railroad? bridge spanning a railroad and a street. This girder is 131 ft. 9 in. long and 10 ft. 6 in. high, and weighs 98 tons. The angles placed in the corners at the junction of the web and flanges form one of the unusual features of the The legs of these angles are girder. 8 in. wide and $1\frac{1}{8}$ in. thick, and each is made of one piece running the full length of the girder. They are said to be the longest angles of this size ever rolled. Particular attention was given in the shop to seeing that the girder was built with the right end

out having to be turned around. This girder is the longest of 15 required in the construction of the bridge.

MINERAL OILS SHOWN TO BE SUPERIOR FOR HARDENING

Experiments recently conducted on hardening oils show that those of mineral nature are superior to the kind originating from cottonseed, fish, or the like. Mineral oils were found to have a hardening effect of from .16 to .24, assuming water as unity, while cotton-seed oil was found to be in the neighborhood of .16, with fish oil at .15. Rosin varied from .13 to .14. The kind of temper a piece of metal receives depends, for one thing, on its rate of cooling, as well as on the chemical composition of the medium in which it is placed. Thus different materials

forward so that it could be loaded, shipped, and used in the bridge with-

PRUNE-GATHERING MACHINE FOR LARGE ORCHARDS

In the prune belt of California the fruit is allowed to ripen on the trees and fall of its own weight. The gathering is then done by hand, which is a slow method that causes difficulty when there is a shortage of pickers. To facilitate this work by saving expense and time, a western inventor has developed a machine which picks the prunes from the ground as it is pushed along by an operator. The work is done by a large revolving drum, the circumference of which is covered with rows of sharp spikes. The prunes are pierced by these members and carried around to a point where they are automatically removed and deposited in a hopper at the rear. It is stated that the fruit is not injured by being perforated in this

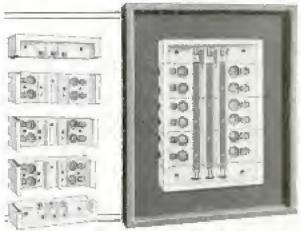

Prune-Gathering Machine Which Dues the Work of Many Men

manner, because it is necessary to prick the skin of the prunes before they are dried.

A CUT-OUT BOX THAT CAN BE BUTLT TO SIZE ON JOB

An eastern manufacturer of electrical goods has devised a cut-out box embodying the sectional idea. The box is not very different from the ordinary, except that it can be had in any number of duplicate units, which may be placed side by side to fit the demands of any kind of electrical installation. Thus it is unnecessary to order a special cut-

out box beforehand as at present, it being possible with this new type to construct one on the job by putting

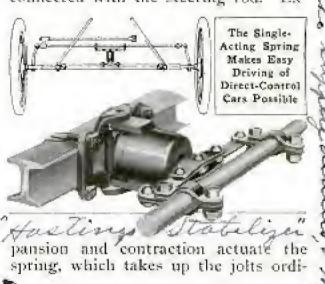

The Separate Sections of the Cut-Out Box Pit Together to Satisfy Any Capacity Desired

together a sufficient number of sections. The ordinary cut-out box is a familiar fixture in most any house or other structure. It is usually mounted on, or within, a wall, and serves to control electrical circuits to various parts of the building.

STEERING ATTACHMENT MADE FOR DIRECT-CONTROL CARS

47360

For certain light motor cars which are not equipped with worm-and-sector steering gears, a spring device which eliminates the strain on the wheel and permits safer and casier driving has been devised. It is a small, neatly housed attachment which is intended to be clamped to the front axle and connected with the steering rod. Ex-

of the Spring field, Mass.

narily transmitted to the steering wheel of cars having direct control. Without some device of this character the steering gear is affected every time the front wheels of the machine strike

a rut, bump, or stretch of sand. The stabilizing attachment prevents swerving and relieves the driver from the constant physical strain which otherwise he is under.

HYDRAULIC STRETCHER MADE FOR HOSPITAL USES

For hospital purposes a stretcher has been built with a hydraulic lifting mechanism which enables it to be ad-

justed to various heights without subjecting a patient to jars and shocks which might be discomforting. The elechassis, that is car-

The Stretcher may be Lowered to the Same Level as a Bed, or Raised Even with an Operating Table

ried on rubber-tired wheels, and supports the stretcher above it. It may be lowered smoothly even with a bed, or raised to the same plane as an operating table, and without requiring exertion on the part of its operators. stretcher itself may also be extended to one side or the other independently of the truck, so as to facilitate the work of moving a sick person onto or from The raising and lowering is done by regulating a flow of oil between two cylinders.

The "Independence," one of the oldest, and at one time the largest, of United States warships, was burned by its owners recently in order to recoverthe copper rivets which were used in its construction.

NEW CALIFORNIA PLANT WILL UTILIZE WASTE LEMON CROP

The Golden State is facing a problem in overproduction. Twenty thousand acres of young lemon trees will soon come into bearing and double the available supply. For the year ended Ang. 31, 1915, the crop was 6,667 cars, or 132 per cent more than the previous year. What to do with all this fruit is proving a considerable puzzle,

One solution offered is a plant to utilize the poorer grades of fruit in making lemon oil, citrate of lime,

and similar products, This is now under construction, and will operate on a cooperative basis, the growers re-ceiving full return for the by-products after paying the cost of pro-By thus disduction. posing of the poorer grades of fruit the growers hope to prevent demoralizing of

the market, as well as to get something from the part of the crop now going to waste. 361

NEW STEAM TRUCK USES COKE AS FUEL

The problem of devising a steamdriven road vehicle in which the firing is done with solid fuel without the necessity for an extra attendant to look after the fire, has apparently been solved in a coke-fired steam truck recently brought out by an English firm. Hills and other conditions bring about a continual variation in the power requirements of such a vehicle as it is driven over the road, and it has been found difficult to devise any kind of mechanical stoker that will meet these

In migri: national Steam Car Co. Its 11 monto ham how be a Chelms & Gylyrightedy Policial inventor: Yhor Charleson

varying conditions satisfactorily. The semiautomatic feed which forms the es- 3 Jamaking RUBBER MATS sential feature of this truck and which enables the driver to control the steaming without leaving his seat, is apparently adapted as well to a passenger vehicle, in which the conditions are more unfavorable, owing to the frequent stops. The coke bunkers are built up the sides of the boiler and are filled through doors at the top. The grates slope from each side toward the center. At the bottom of each bunker is an opening of such size that the right amount of coke to take the place of that burned on the grates is fed through it by gravity. When a hotter fire is needed, as in climbing a hill, the driver simply works certain levers placed within his reach. These levers rock the grates, clearing them of ashes and clinkers, and also oscillate a set of bars that project into the bottom of each of the bunkers. Through the action of these bars the coke is loosened and made to flow to the grates more freely. In addition to these features there is provided a forced draft which is also operated from the driver's seat. This consists simply of a special nozzle which admits steam to the base of the chimney and thus accelerates the combustion.

GARDEN HOSE UTILIZED FOR

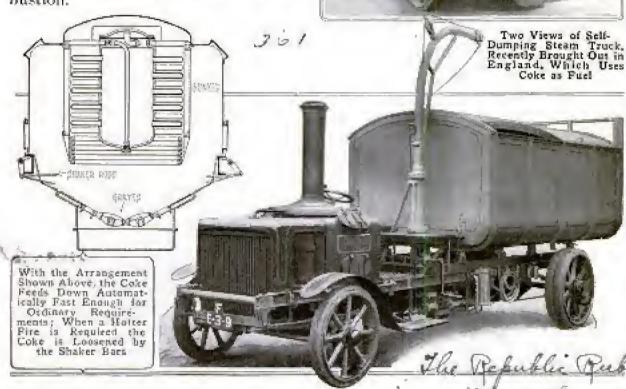

Considerable saving in the cost of rubber mats is brought about by a

How Garden Hose Cut into Short Lengths is Used as a Filling for Rubber Mats

plan just invented for using scrap garden hose as an insert instead of making a solid rubber mat or using a

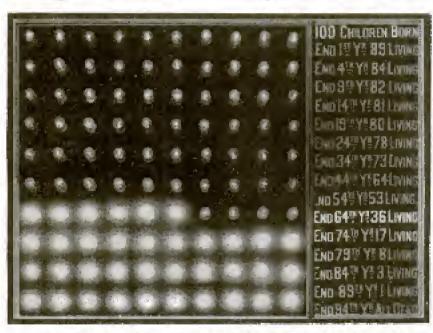

ventor: Web. Bro

The Gilliams Lervice, 116 Waverly De

cloth insert. The garden hose is cut into small pieces which are set on end, cemented together, and then impregnated with rubber. The filling thus formed is surfaced on each side with a sheet of rubber, an extra layer of fabric being placed under the upper surface in case the mat is to be subjected to rough usage. The whole is then cured together, making a solid unit which gives an equal distribution of strain. Other kinds of material than garden hose can be used as a filler, the degree of resiliency depending on the kind of tubing employed. The mat can be made in any thickness from ½ in. up.

GOTHAM DEATH RATE SHOWN /49BY ELECTRIC CHART

In compiling vital statistics showing the mortality rate in New York City, the Department of Health investigated

All of the Lamps are First Lighted and Then Successively Extinguished to Indicate the Rate of Mortality

more than 225,000 deaths. The findings are so significant that an electrically illuminated chart has been built to display the figures for an obvious purpose. The statistics given on the sign trace the length of life of the average New Yorker by starting with 100 infants and showing the rate at which they die. At 89 years only one out of the entire group survives, and at 94 years all are dead.

CFishing lines now being made by the Japanese from wild-cocoon silk are said to be especially valuable in taking game fish, since they are, invisible un-" der water.

STEAM SHOVEL BEGINS WORK FOR GOVERNMENT BUILDING

In beginning the excavating work for the new home of the Department of the Interior at Washington, the for-

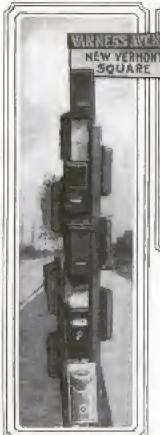

mality of breaking the ground was carried out without the use of picks or shovels. Instead of a golden spade, or even an ordinary one, a large, modern steam shovel was employed for the first time in such a ceremony at the national capital. At the pointed time, the assistant secretary of the treasury, in the presence of a number of government officials, pulled a rope which opened the clam and dropped a load of earth into an awaiting wagon. The

building, which will cost approximately \$2,000,000, will be constructed in accordance with the general plans laid out a number of years ago for the "ultimate Washington."

8991 MAIL BOXES ROOST LIKE BIRDS IN COLONIES

martelo Fifty-six mail boxes all nailed to the same rack is rather an unusual sight. It is stated that at one time there were as many as 70 boxes on this same rack. It is located in a suburb of a western city and was put up by the residents of a newly built-up section of

territory, which ordinarily would be served by rural carriers. However, by erecting this outdoor post office within the limits reached by city delivery, the res-

idents of the district were enabled to receive mail more than once a day. In another instance a street signpost served the same purpose as the rack. In this case there were 16 boxes all on the one post.

HOW ALKALI AFFECTS CEMENT DRAIN TILE

As the result of a series of experiments conducted by the United States Bureau of Standards it has been found that the alkaline soils found in some sections of the West are destructive to cement drain tile unless the tile is of the best material and has been made with the greatest care. Well-made tile of a mixture as rich as one part cement to three parts sand and stone combined, is apparently not affected by the alkali, but tile made of a leaner mixture than this is likely to disintegrate within a short time when placed in a soil having a strong alkaline con-These conclusions are based on tests extending over a period of one

year. Book oran Bureau

FOLDING STAND IS DEVISED 472 FOR PORTABLE TYPEWRITER

For the convenience of travelers who make use of a portable typewriter, a light, substantial metal tripod has been

designed which serves quately 0.5 stand for the machine, It folds compactly and fire into a case, 1016 ili. long, which has a maximum diameter of 2% in. When in use it is 241/4 in, in height and supports a typewriter at the proper distance from the floor. By means of a bracket, which may be secured to one side of the

stand, an arm is provided for supporting a notebook or loose leaves of copy. There are no screws or clamps to fasten when a machine is placed on the tripod, and the absence of reflecting surfaces tends to dissipate the sound waves arising from the operation of the typewriter, so that an operator may work on a train, in a hotel room, or in any public place, without making an objectionable noise.

RAILWAY-SYSTEM TEST PLANT MODEL EFFICIENCY

PRACTICALLY all of the standardization tests incident to the acceptance of some \$80,000,000 worth of materials and equipment purchased annually by one of the eastern railways, are conducted in the laboratories of an inspection plant lately established at Altoona, Pa. The shop holds particular interest at this time when the demand for efficiency is gaining impetus; for it represents an institution in which figures and facts replace guesswork.

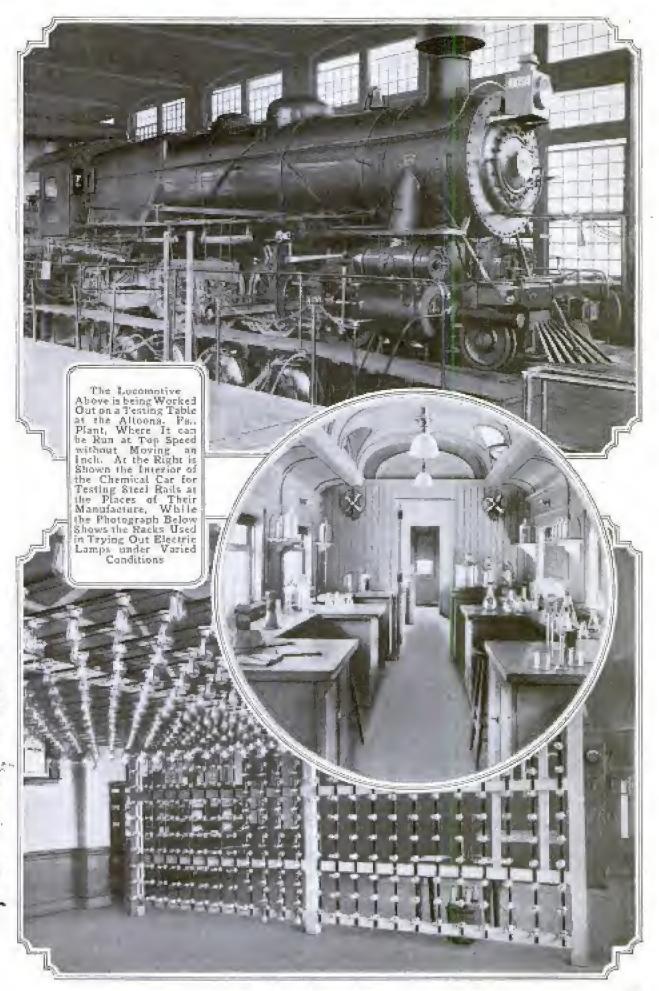

The test department of this railroad is maintained at an expense of approximately \$500,000 a year. Its major purpose is to pass upon the quality and fitness of the goods and supplies bought by the corporation. This gives a suggestion of the magnitude and varicty of the tests performed at the plant, where a staff of 350 persons is engaged in examining thousands of articles ranging in character from soap and plush to pig iron, incandescent lamps, and locomotives. In the chemical laboratories alone more than 50,000 routine tests are made yearly. As a result of this system of scrutiny, an annual average of \$1,000,000 worth of goods is rejected.

Nearly all of the departmental loads, without moving an inch. branches are concentrated in one building, which affords 41,000 sq. ft. of floor space and was erected and equipped at a cost of about \$500,000. The structure is five stories in height and has a subbasement which provides space for a receiving room for materials, a machine shop where the laboratory apparatus may be repaired, vaults for the preservation of records, and a chemical-storage room. The equipment of the machine shop includes two 14-in. engine lathes, a 12-in, lathe, a 24-in. radial drill, a \$4-in. shaper, milling machines, and other facilities for the preparation of metal specimens prior to their tests. All of the machinery in the plant is electrically operated.

The first floor of the building is devoted to the physical laboratory. Five machines are provided there for testing the tensile strength of materials. One of these has a capacity of 1,000,000 lb. and is capable of gripping the ends of a piece of steel as large around as a fence post and stretching it out like rubber until it breaks. Laboratories for gas and water analyses, the examination of rubber goods and electrical instruments, bacteriological tests, and photometry occupy the third floor. Chemical experiments and tests are conducted in laboratories on the floor above. By extending the central bay of the building, a fifth floor has been provided which serves as a photographic laboratory. The roof of the structure is used also for photographic purposes and for testing the durability of paints.

The locomotive test shop is separated from the main plant, as are some other of the divisions. Instead of taking a passenger or freight engine out on the road and making it pull a string of cars over different grades in order to test its capacity, as was once done, it is driven into the shop onto a testing There it rests on a series of heavy wheels which form a sort of treadmill for it, enabling it to be worked out thoroughly, "run" at a high rate of speed, or made to pull enormous

Many of the tests are made as nearly similar to conditions met in service as is possible. The stay bolts of a locomotive, for instance, are subjected not merely to a pull, but also to a peculiar twisting strain such as is encountered in actual use. Car springs are tried out in a beavy apparatus which compresses and releases them alternately. After a spring has undergone thousands of compressions in this manner, it is taken out and measured to ascertain the amount of clasticity it has lost. In testing incandescent lamps, a large rack is used in which 1,000 bulbs are inserted at one time. This is done in determining the efficiency and probable life of various kinds of lamps. Currents ranging from far below normal to excessive strengths, are used for this purpose. Food products used in the dining service, the drinking water

provided in stations and on trains, the condition of the atmosphere in various tunnels, and divers other things of similar character are tested regularly.

Much experimental work is done in order to devise means for lengthening the life of materials, as well as general equipment. For instance, some 286,800 cars periodically require painting. This is a big item of expense, and attempts are continually made to produce paints of greater durability. When a car is in the paint shop it represents a liability to the company instead of an asset. Therefore efforts are made to devise practical means for lessening the time required in painting

cars. A pronounced step in this direction was made not long ago. As a result of experiments, a great oven was built in which freshly painted cars are baked. This process reduces the length of the drying period 95 per cent and cuts in half the total time a car is kept out of service when being repainted.

To facilitate the work of testing steel rails, a car has very recently been fitted out as a chemical laboratory. This, when in use, will be sent to mills where rails are manufactured. Its attendants will thus be enabled to make their tests on the ground as the rolling is being done, which will save considerable time and delay.

OLD BRIDGES TRANSFORMED JS6 WITH CONCRETE

In one of the counties of southern Kansas novel work has been accomplished in reclaiming old dilapidated

This Bridge. Pormerly an Old, Unsafe Steel Structure, was Made Serviceable by Coating It with Concrete

steel bridges which had been condemned. Instead of razing them and erecting new ones in their places, they have been converted into substantial, reinforced-concrete structures. has been done by building wooden forms about the structural members and filling them with concrete. Thus the framework of the old bridges has been employed as reinforcements for the new ones. Metal bars and other pieces used in bracing the original structures provided reinforcement for the flooring.

666 THE "GROCETERIA," LATEST TYPE OF GROCERY STORE

The latest innovation in grocery stores is the "groceteria," which, as its name implies, is operated on the same

plan as the cafeteria. In these institutions, three of which have already been opened in Santa Monica, Cal., there are no clerks, bundle wrappers, deliverymen, or bookkeepers, and, since they are run on a cash basis, there are no bad accounts. It is claimed that because of these conditions there is a saving of from 15 to 40 per cent for the consumer. Each customer simply helps himself to

the articles he desires. As he departs the cashier checks over the goods and determines the bill. canned goods take care of themselves without any attention, but it is necessary for the management to weigh and pack groceries that come in bulk. This is done in advance at times of the day when trade is not brisk.

TElectric ovens are being used in German field hospitals for the treatment of bullet and shrapnel wounds.

MOTORCYCLIST IS SHIELDED FROM AIR BY DEFLECTOR

For motorcyclists, a simple deflector has been devised which, when attached to the handlebars of a machine, diverts the air currents over the head of the rider, leaving him in a comparatively still atmosphere while driving at almost any reasonable speed. It consists of a rectangular metal case containing a series of parabolical vanes, which form curved channels inside the case. When a motorcycle is speeding along with this apparatus fixed before its driver, the air enters the front of the deflector and is shot out of the top at a 45° angle. The air coming in the plane above the deflector strikes the upgoing current and is diverted by it so that it also takes an inclined course. This protects the upper part of the

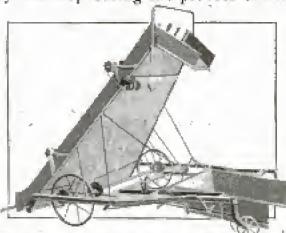

riders body from wind and dust. The device is supported a few inches above the han-

dlebars so that it is about a foot below the rider's chin. In this position it does not obstruct the view or cause any inconvenience in driving. It is said that when the deflector is used for the first time a rider

has difficulty in estimating his speed, because of the stillness of the air about him. While traveling at a good clip it is possible for him to light a cigarette or cigar without trouble. These points tend to illustrate the effectiveness of the apparatus.

NEW MACHINE FOR SHOCKING / 9 9 ALFALFA

An alialfa shocker that picks up the hay just as it is left by the mower and places it in the shocks without the necessity for gathering it into windrows, is now being introduced in the alfalia-growing sections of the country. This machine does away with the hay rake, which often incorporates considerable quantities of dirt in the freshly cut crop during the process of rak-

With This Shocker the Alfalfa is Placed Directly in the Shocks Instead of being First Gathered into Windrows

ing. The inventor claims that the machine acts as a saver of food value, since by placing the alfalfa crop in the shock as quickly as possible at least 90 per cent of the leaves can be saved. With this method of harvesting, the alfalfa is cured by the circulation of the air through the shock rather than by the action of the sun's rays.

NEW IRRIGATION SYSTEMS

Several large irrigation systems in the Hawaiian Islands, on which work has been in progress for some years, are now nearing completion. One of these systems, located on the island of Kauai, comprises several miles of ditches and about 10,000 feet of tunnel. Another large system, which is rapidly approaching completion, is located on the island of Oahu and passes under the Koolau range near Honolulu, by means of a tunnel seven miles long. This tunnel is to be used for carrying water from the Waiahole Valley to the lands of a sugar company located on the opposite side of the island.

The Japanese government is considering the advisability of transferring to private ownership all the factories now owned and operated by the government.

USING A CHEMICAL TO KILL WEEDS ALONG RAILROAD

A chemical spray for killing weeds and other vegetation on the roadbed, now being used on a number of railroads, is said not only to be highly efficient for this purpose but to provide an excellent preservative for the track structure. The chemical is car-

How the Chemical is Applied to the Roadbed for Killing Weeds and Other Vegetation

ried in one or more tank cars and is applied at a pressure of about 15 pounds through an extension arm consisting of a pipe perforated on the under side. This arm is hinged and can be quickly raised out of the way of obstructions. On a railroad in South Carolina it required 126 gal. of chemical, diluted with 3,024 gal, of water, to spray a width of 12 ft. over a mile of roadbed. One application of the chemical each season is usually enough to keep the roadbed sufficiently clear of vegetation.

SHIPS USING PANAMA CANAL SHOULD SIGNAL APPROACH

In order to expedite the passage of vessels through the Panama Canal, the authorities in charge are calling upon ship masters to announce their approach by wireless. A general rule governing this point was posted with other regulations when the waterway was first opened, but according to recent advices it has not been closely followed. More than half of the ships crossing the isthmus carry radio equipment, but only about a fourth of these have observed the practice of signaling

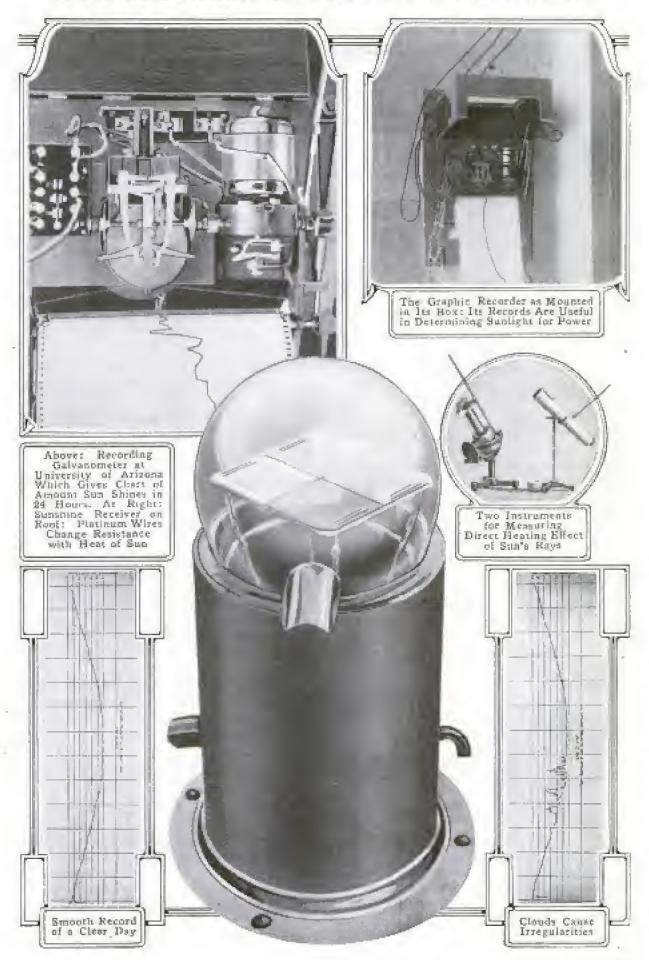

their approach.

Unnecessary delays and more or less trouble frequently result when ships arrive at the portals unannounced. When their masters communicate with the canal authorities, on the other hand, sufficient time is allowed to prepare for meeting different problems and handling the traffic more smoothly than would otherwise be possible. There are few vessels equipped with wireless which would be unable to furnish advice of their probable time of arrival 24 hours in advance, if their masters were so disposed. Matter of this character is handled without charge at the government stations. At the present time 2,300 messages, most of them of this nature, are handled at the Colon plant and some 400 communications at Balboa.

The canal radio stations are performing quite an interesting service which is probably not generally known outside of commercial and shipping circles. Each afternoon at 3:30 o'clock the Colon station sends out general news bulletins which are picked up by vessels in various parts of both oceans. At noon weather predictions relating to the Caribbean, South Atlantic, and Gulf regions are also sent out broadcast. Information concerning the positions of dangerous derelicts, and other matters pertaining to the welfare of navigators, is filed at regular intervals.

CLarge deposits of potash salts have recently been discovered in Spain.

4.06 SIMPLE DEVICE FOR TIMING TELEPHONE TOLL CALLS

The time consumed in making a toll call is easily and accurately checked by the use of a simple timing device

just placed on the market and designed

With This Special Clock the Time Consumed in Making a Telephone Call is Accurately Registered

having a single hand and a dial so divided that six minutes are registered with one revolution of the hand. The clock is started and stopped by means of a lever at the top of the case. The hand is first set to zero and, with the completion of the toll connection, the clock is started by pushing the lever to the right. When the conversation is completed the clock is stopped by pushing the lever to the left. One winding of the clock is sufficient for 1,000 three-minute calls.

INDEX CARDS KEPT CLEAN IN NEW FILING CASE

For sanitary reasons as well as for convenience and efficiency, a cardindex filing system, arranged according to a new plan, has been introduced for office purposes. The chief points in its favor are that it offers a means of locating a card quickly and without allowing the record slips to be fingered or soiled. This keeps the cards in a clean condition and prevents them from

being worn or contaminated with filth because of frequent reference. The filing drawer is fitted with a plate-glass cover that protects its contents from dust. Passing through the center of it at the bottom is a small rod on which the perforated cards are threaded. On another rod extending along one side of the drawer is fitted a sliding device which acts as a finder. In locating a specific card, the operator makes use of this mechanical hand, which, when moved to and fro, turns the cards forward one at a time. The reading is done through the glass, which is intended to be removed only for the insertion of new cards or the removal or correction of old ones,

HOW A SHIP'S STABILITY IS DETERMINED

BY JOSEPH R. OLDHAM, N. A.

(Since the appearance of the article on the "Bastland" disaster in the September number of Popular Mechanics Magazine we have received many requests for a more detailed explanation of the "metacentric height." The following article, written by an engineer and marine expert, makes this technical subject simple enough, we believe, for anyone to understand.—Editor.)

THE metacenter is a measure of the comparative stability of a ship. It is a fixed point, for one draft of water, through which the buoyancy may be assumed to act for all angles of inclination up to about 15° from the upright. It is also the point above which the center of gravity of a floating vessel cannot be raised compatibly

with stable equilibrium.

In Fig. 1, the metacenter is marked M, the center of gravity is indicated by G, and the center of buoyancy is marked B. Though the altitude of the metacenter is measured from the center of buoyancy as its base, the actual power of the vessel to return to the upright position depends upon its height above the center of gravity of the ship, and not primarily upon its distance above the center of buoyancy. The metacenter may be compared to a pendulum having its point of suspension at M, and its weight concentrated in a bob at the center of gravity G. This distance is commonly called the G.M. So long as G is below M, the ship is in stable equilibrium. If G is above M, as indicated in Fig. 2, the ship is in unstable equilibrium. If G coincides with M, the ship is in neutral or indifferent equilibrium.

Consider a deep vessel, such as shown in section in Fig. 2, made still deeper by the addition of an upper deck, and then loaded with grain and no water

ballast carried, which was actually the case in the Atlantic trade a few years ago. This raised the center of gravity about three feet, moved that center slightly above the metacenter M, and produced a metacentric height of minus 5 in., and developed a heeling moment of nearly 3,000 tons, which caused the shifting of cargo and the capsizing of the vessel. The basic defect of this construction was excessive Here it may be pertinent to state that when the depth of a bulkcargo vessel, from the keel to the strength deck, materially exceeds 60 per cent of the extreme breadth, the structure may be considered as too deep. Though this vessel was deficient in statical stability, due to the low metacenter and the high center of gravity, it is, however, quite possible to have too great a metacentric height. If this height be excessive, due either to the high altitude of the metacenter, or to the low position of the center of gravity, or to a combination of these elements, the vessel will oppose too great a resistance to beam seas, thus setting up uneasy rolling and developing excessive vibration. This may be illustrated by Fig. 3, which shows a vessel with great metacentric height, due to small displacement, largely concentrated near to the load water plane, and to the great breadth of beam—the potent factor of a large moment of

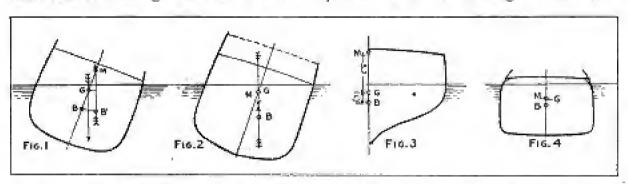

Fig. 1. Great Metacentric Height, Due to Fine Lines and Small Displacement; Fig. 2. High Center of Gravity Resulting from Excessive Depth, and Low Metacenter Due to Narrow Beam and Deep Immersion; Fig. 3. High Metacenter Due to Great Breadth of Load Water Plane, Small Displacement and Immersion; Fig. 4. Low Metacenter, Due to Large Displacement and Contracted Breadth of Load Water Plane

inertia. In this example the metacenter is 7.4 ft. above the center of buoyancy B, and as the center of gravity G is 1.7 ft. above the center of buoyancy, the metacentric height, or G.M., is thus 5.7 ft. The stiffness of a ship varies with the metacentric height. If it be doubled, the stiffness is doubled; if halved, the stiffness is reduced by one-half, and so on, in like proportion.

Though most of our lake steamers have an excessive metacentric height, due to the combination of a low center for gravity and a high metacenter, caused by the large moment of inertia of the load water plane and shallow draft of water, there are a few vessels afloat on these seas which exhibit a very moderate height when fully laden with a homogeneous cargo of low specific gravity. Some years ago, two large Atlantic liners were constructed resembling the outline section marked Fig. 4. These vessels had a "tumble A home" of 7.5 ft. In other words, they were 7.5 ft, narrower at the deck than 🔌 🛬 at their broadest point. Ships of somewhat modified design were constructed on the Great Lakes. Their architectural characteristics are a moderate Smoment of inertia, due to the diminishing breadths of the load water line, and large displacement with a low center of buoyancy, whose geometrical resultant is a low metacenter and

small metacentric height. This combination, however, can be readily counteracted by a judicious disposition of the weights carried, or by running some water ballast into the tanks, which would immediately lower the center of gravity and proportionately augment the metacentric height. They are, however, good sea boats and easy rollers, and they carry such cargoes safely, as their sides are strong and intact, with the exception of the small port aft, which is closed and made water-tight during severe weather.

Although the metacentric method is reliable primarily to demonstrate initial stiffness, or stability, it is susceptible of much broader application by shipbuilders of mature experience. Though a ship cannot capsize while she retains a metacentric height, it is equally true that certain types of ships, possessed of ample freeboard and unperforated top sides, may not capsize even though they have no metacentric height in the upright position. I have observed many such examples of similar vessels which were abandoned They heeled over toward an inclined position of stable equilibrium and there acquired a small metacentric height and a righting moment, continued to float, if the sea did not enter through the batchways, and were finally salved.

Among the toys recently invented for children is one which is modeled after the old crossbow of medieval

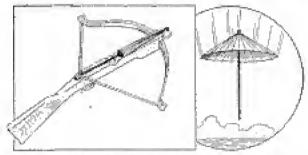

Curtains and Pieces of Lace are Secured to the Netting by Means of Specially Designed Clamps

frame has been brought out abroad which does away with the tedious task of adjusting forms such as are usually employed. The device consists of a wooden frame covered with a strong, large-meshed, nonmetallic netting. The articles to be dried are stretched to the surface of this by means of special spring clamps. Each of these is provided with a hook on one end which may be engaged in a mesh of the net. The clips are made in a number of styles with jaws of various patterns and sizes to suit the specific requirement of different articles. Besides its time and trouble-saving advantages, the frame prevents the distortion of the laces.

enough of the laminae to bring the strip down to the required thickness. This climinates the laborious and exacting method of filing a bar to an accurate thickness, and offers greater convenience than the loose-leaf shim. The separate laminations are made in two thicknesses, .002 and .003 in., and by peeling off successive layers it is possible for an inexperienced workman to make a smooth, uniform shim of the required size.

FURNACE OF NEW DESIGN FOR STUMP BURNING

For clearing logged-off lands an Oregon man has patented a firing apparatus which is intended to facilitate the burning of stumps and do away with the necessity of grubbing and blasting. It is simple in design, and according to its inventor, is capable of destroying the upper portion as well as the root system.

It consists principally of a saddlelike hood with a flue and auxiliary apparatus for inducing a draft and stimulating the fire. In using it, a 2-in, hole

The Operation of the Apparatus Is Inexpensive Because Fuel of Almost Any Character may be Used

is bored horizontally into the stump below the surface of the ground. This extends through the sapwood on a side from which the bark has been stripped. The ground adjacent to the hole is excavated so as to form a bed for the fuel. The furnace, which is made of metal with one end and its bottom open, is then set in place, while a pipe, less in diameter than the bore in the stump and provided at its far end with a wind funnel and vane, is set in close prox-

LAND DRAINAGE IS PROBLEM
OF EGYPTIAN FARMERS

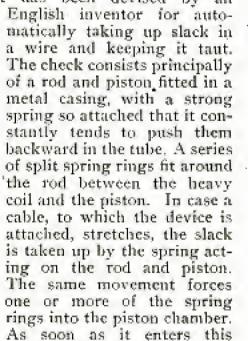

OF EGYPTIAN FARMERS
Agriculturists in Egypt are facing a peculiar situation which has been brought about by the promotion of irrigation. The financing of projects for supplying water to arid lands has not been attended with the difficulty met by drainage propositions. cause of this, certain districts once unproductive on account of the scarcity of water, are now suffering from an excess of moisture. Obviously much of the reclamation work has not been carried out as intelligently as it might have been, for conditions in some places have merely been changed from one extreme to another. The lack of

drainage facilities has caused fields to become soaked with water, ending with perfectly apparent results. Disastrous years have caused just as urgent a cry to be raised for drainage as was ever made for water, and eventually a normal balance will doubt-less be established.

Egyptian cotton, which is of excellent quality, is grown almost entirely upon Nile land. A strip of soil reaching back about one mile on either side of the stream constitutes what at present is said to be the only area suited for cotton production. The country's part in this industry is governed by irrigation, and this in turn is controlled by the amount of water available in lean years. There has been a tendency to bring more land under cultivation, it is claimed by one authority, than could be maintained in years of minimum rise by the available irrigation facilities.

Cover for a Drinking-Fountain Pipe

The drinking fountain in the playground in our city, when first erected, was merely a section of pipe with the cup attachment screwed into it. Recently a concrete base has been added, and a terra-cotta chimney top bedded

Terra-Cotta Chimney Top Used as a Protection and Ornament about a Drinking-Fountain Pipe

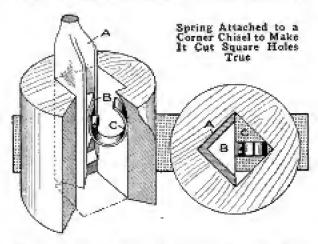

into it as shown. The concrete base is convenient for the youngsters to stand on, and the chimney top serves the double purpose of protecting the pipe and carrying the waste water down into a drain pipe running from the bottom of the chimney out into the gutter.—Contributed by James M. Kane, Doylestown, Pa.

Cutting Long Square Holes in Wood

It is often necessary to cut square holes through blocks of wood, and if the holes are of considerable length it is difficult to make them square and smooth. The tool illustrated is quite an aid for such work, and is simple enough for anyone to make.

An ordinary corner chisel is repre-

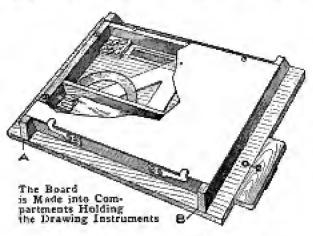

sented at A, into the angle of which is soldered a small block, B. To this block is fastened, by a small screw, a spring, C, of sufficient size to reach the opposite corner of the hole to be cut. The hole should be roughed out

first, after which it is easily finished with the corner chisel arranged as shown, since the spring C always forces the chisel down flat and holds it firmly in the corner as it is pushed through.—Contributed by J. A. Brearley, Washington, D. C.

A Portable Drawing Outfit

The illustration shows the construction of a self-contained drawing outfit, which is of value to engineers and students who find it necessary to carry drafting instruments to and from work. The size of the board is such

that it can be easily carried in a suitcase, and fair-sized drawings can be made upon it.

The drawing board is made of soft

pine, or poplar, 3/8 in. thick by 14 in. long, and 12 in. wide. Three strips, with the grain of the wood running lengthwise of the board, are used for the board. The edges are made perfeetly square and straight, for the use of the T-square,

The compartments for the instruments on the back of the board are made between two hardwood cleats, A and B, placed 1 in. from each end, and two similar cleats lengthwise, 1 in. from the sides. The cleats should be fastened to the board with wood

The compartment formed within the cleats is divided in the center with another small cleat. A cover is made from a piece of sheet metal, aluminum preferred, and fastened in place by slots on one side which slip under round-head screws, and by spring clips on the other side. screws are driven almost down and filed flat.

In one compartment there is fitted a small chamois pouch, having pockets to receive the instruments, while in the other side there is room for a scale, protractor, triangles, pencils, etc. one corner of one side, glue a small block of soft wood, to hold the thumb A T-square may be made to fasten across the face of the board by using small brass screw eyes and hooks. The blade of such a square should be about 1½ in. wide, and just as long as the board.—Contributed by C. H. Van Fossen, Fayette, Ohio.

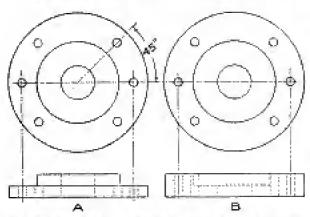

A Place for the Automobile Switch Key

If the key for the switch lock of an automobile is made of steel, it can be safely and conveniently kept in the car when not in use by attaching it to a small permanent magnet, concealed under the false dash, or elsewhere. Should the key be of brass, a steel duplicate can easily be made, or one may be made of tool steel, then hardened and magnetized so that it will adhere to any steel, or iron, part of the automobile. — Contributed by Carl F. Woodbury, Halifax, Nova Scotia.

Economy in Making Templates

A piece of work, shown at A, required holes drilled accurately, and quite a number of them were needed from time to time, making it necessary to have a template, as shown at B. The template was first made of machine steel and casehardened. The holes were rapidly, and the template had to be discarded, and a new one made quite often.

To make a template that would stand the wear and not require a large amount of tool steel, one was turned up of machine steel, and the places for the holes were located and drilled for tapping with a \%-in. machine tap. Then the holes were tapped, and a piece of \%-in. tool steel was threaded and turned into each hole, and slightly peened over. The piece was then faced off, the places for the holes accurately marked on the tool-steel inserts, and drilled. The whole piece was heated, and the tool-steel pieces tempered. This formed a template as good as if

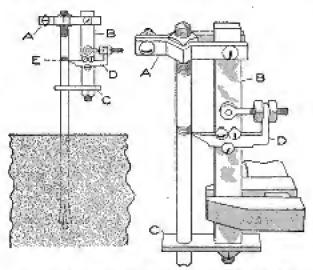

A Template Made of Machine Steel with Tool-Steel Inserts for the Holes

it had been made entirely of tool steel.—Contributed by Clarence H. Anderson, Worcester, Mass.

Cutting Threads on Foundation Bolts

In placing an engine on a foundation in a stone quarry, I found that some of the bolts had to be shortened about 3 in., and as these bolts were split on the lower end and an iron wedge inserted in the split it was impossible to remove them. The threads varied in size owing to the bolt sizes, and by cutting off the necessary length from each bolt the threaded portion would

The Threaded End of the Bolt Provided a Means of Feed for Cutting Other Threads

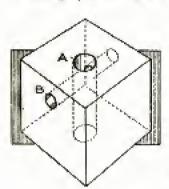

be removed, thus making it necessary to cut new threads on the bolt ends. The bolts being located so close together, it was impossible to use ordinary stock and dies. It required a special threading tool, which was made as follows:

The nut was placed on the end of the bolt and turned to catch one thread. A clamp, A, was made of flat iron and screwed fast to the nut with screwhead bolts, as shown. A piece of flat iron, B, was drilled to fit the clamp A, the other end being provided with a thread and nut. An arm, C, was made of a piece of iron and bolted fast to the flat iron B. A thread-cutting tool, D, was made of flat tool steel, ground to the proper cutting point, and then clamped to the flat iron B with three screws. The device was placed on the bolt and the nut given a turn on one thread, then a wrench was applied to the bar B and by turning the nut, the tool cut the thread, the nut being used as a means for the feed. After cutting the thread the bolts were cut off at E. -Contributed by A. L. Kerbaugh, Allentown, Pa.

Turn the tailstock center of a lathe sufficient to take up the slack, and no more.

To Remove Burrs from Holes

The block shown is typical of many drilling jobs. Two holes, A and B,

are to be drilled and one runs into the other. It makes no difference which hole is drilled first, the second hole throws up a burr in the first. The softer the metal the larger the burr, especially

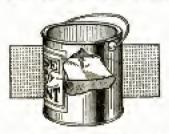

on brass. If one of the holes cuts only part way through, a small, thin shell of metal is left rather than a burr.

To take out the shell or burr, grind an ordinary twist drill flat on the end, and give the usual clearance to the flat edges. A drill so ground will do better and quicker work than one having a taper point. It will cut fast enough, and remove the proper amount of metal to please the most exacting production manager.

Another way in which this can be done is to insert a plug in the hole first drilled. If one or two pieces are to be drilled, this is a good way, but is too slow for quantity work. For a hole that only comes half through, a half round may be filed in the plug and it can be used over and over again.

Covering Paint in Pots Overnight

Paint in pots left overnight will harden on the surface sufficiently to

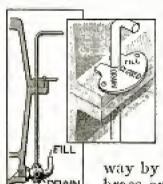

make a scum that must be removed before starting work the next day. I avoid this by covering the surface of the paint

in the pot with a disk of wax or paraffin. The disk is about ¼ in thick, and should be of a size to fit snugly in the pot so that it will float on the surface of the paint. This covering prevents any scum from forming and

keeps the paint free from small bits of hard paint. When molding the disk a piece of wire should be put in so that a part of it will project from one surface, to make a handle for lifting the disk out of the pot.—James A. Hart, Philadelphia, Pa.

Dial to Locate Swing of Oil-Cock Control

The oil cock on the engine of an automobile was of the combination filling and drain type; that is, it could be opened one way to receive oil into the crank case, and the other way, to drain the lower half of the crank case of oil. The lever controlling the cock was made, as shown, without any provision for guiding it. The case was frequently drained by mistake when it was de-

sired to open it for filling, causing the sod pan to drip continually from waste oil. A plan was finally devised to prevent the turning of the control the wrong

way by making a piece of brass on which the words "fill," "closed," and

"drain" were stamped, and then fastening it to the flange of the upper case by means of screws.

Making a Reamer Cut Oversize

When a smooth, round hole of small diameter is required, a hand reamer is used to produce it, and many times the reamer is from .001 to .004 under size. The reamer may be made to work effectively in the following manner: With a scraper made of a medium-size, half-round file, burnish the face of each flute with the oval side. This will raise an edge and cause the reamer to cut larger, the size depending on how long and bard the faces are burnished. This, of course, does not make a permanent edge, but it does very nicely in an emergency.

A Small-Farm Workshop

BY FRANK L. RUSSELL

TT makes little difference whether a person owns a large farm or a truck garden, a place for small tools is not only convenient but almost a necessity. The house can be of a size proportionate to the requirements. The one illustrated is suitable for a small farm, and makes a place for the small hand tools, as well as provides a place where one can occupy spare time in making repairs and keeping the

implements proper shape.

The size of the house is 7 by 12 ft, and 7 it, high at the eave. Lay out the ground selected for the size of the house and make a level place, digging into the earth from 4 to 6 in., on which place a solid A box inclosure orshould be m a de o i boards so that its inside dimensions are 7 ft. by 12 ft.

The height of this box may be from 6 to 8 in., depending on how high the floor is to be raised from the surface of The upper edge of these the earth. boards should be well leveled in all directions so that in making the filling of concrete the surface will be level.

Tamp in a solid bed of cinders so as to make the surface a trifle lower than the surrounding ground. Make a mixture of concrete, using 1 part cement, 2½ parts sand, and 5 parts of broken stone or gravel, and fill into the space to within about 1 in, of the top, tamping it down firmly while putting in the mixture.

The space left at the top is filled in with what is called a neat mixture, 1 part cement and from 1 to 2 parts sand. This is struck off level with the upper edges of the boards and troweled to make it smooth.

As this forms a perfectly level surface there is no way to fasten the wood structure on top of it. The fastening, however, may be made in one of two ways: by setting bolts in the concrete while it is soft, or by drilling holes in it after it has hardened and leading holts in the concrete. In setting the

> bolts, be to have them 13/4 about from the edge, and that about in. of the threaded end projects above the surface of the concrete. Two or three 1/6-in, bolts are required for each end of the building, and four or five should be used on each side.

 \mathbf{A}_{-} plate made of studs, 2 by 4-in. material, is fastened with the

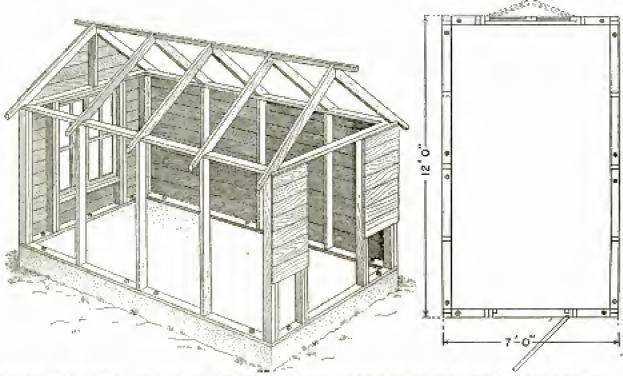

bolts so that its outer edge will be flush with the cement base. After these are securely fastened with the bolts, construct the end and side wall studs in the same way as building a house, cutting the studs to square the ends and making them with both top and bottoin plates just 7 ft. over all. It will require four studs for each end and seven for each side. It is built up square on the ends as well as the sides, using two studs together at the cor-The upper plates are mitered at the corners so that the frame will be securely held together in a rectangle.

The rafters are cut to the pitch desired and fastened in position with a narrow board between their upper ends for a ridge. Ordinary siding can

A Place for Small Tools Is Not Only a Convenience but Is Almost a Necessity for the Farm, and a Workshop for Leisure Hours is Provided at the Same Time

be used, but since this is just a tool house and workshop, rough sheathing boards are put on, using halved joints tle pressure is sufficient to prevent the glass from turning. The tube was chucked and centered by running the

Ground Plan Showing the Location of the Studs and the Openings for the Door and Window, the Former a Regular Batten Door and the Latter Made Up of Two Casement Sash to Swing Outward

at the corners and allowing door and window spaces in the ends. Sheathing boards are put on the rafters and shingles laid.

The arrangement of the bench and hooks, or clips, for holding the tools can be made as desired and in the manner suiting the builder best.

Working Glass in Machines

At one time we had an order for a lot of glass tubes, inside diameter ½ in., outside diameter ¾ in., and 10 in. long, to be threaded on each end with eight threads to the inch. The lathe was geared up for this thread, and a three-jaw universal chuck put on the spindle. The tubes were chucked with a piece of leather placed between the jaws and the glass. Near the other end of the glass tube the center rest was set, and a piece of leather was folded over each end of the center-rest jaws and wired in place.

This leather idea was to prevent scratching the glass surface. Very littail center up and setting the jaws of the center rest.

A 4-in, drum pulley was taken from the small tool grinder and put up over the lathe, and a tool-post grinder, carrying a beveled emery wheel, was set in the tool post instead of the threading tool. The tool-post grinder was belted to the 4-in, drum pulley, and the emery wheel set with a center gauge, whereupon the thread was cut as usual.

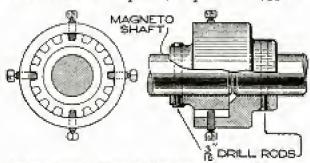

We found that by using hard wheels, dressed to suit the work, or by using a combination of wheels, glass can be worked as easily as cold-rolled steel. This would apply to planer work as well. Glass should be worked at high speeds, and a dull surface will be the result. The emery wheel must be kept wet, either by using a centrifugal pump or by means of the tin can with a hole punched in the bottom.—Contributed by J. B. Murphy, Plainfield, N. J.

CA little salt put in a forge fire will sometimes help wonderfully.

Homemade Magneto Coupling

In overhauling an automobile it was desired to change the ignition system. from low to high tension. The hightension system necessitated the installing of a magneto generator, and in addition a special type of adjustable coupling between the generator and the engine. The adjustment is necessary in order that the spark may be advanced or retarded at will. magneto installed was a secondhand one, but to install a new coupling meant an expenditure of nearly twice that of the magneto. This being the case, it was decided to make one, with the result shown in the illustration.

A search of the junk heap in a nearby garage produced an old transmission spur gear and an old clutch ballbearing housing. The gear was carefully cleaned up in a lathe and rebored to fit the magneto shaft, after which it was riveted in place, a piece of \(\frac{4}{16} \)-in.

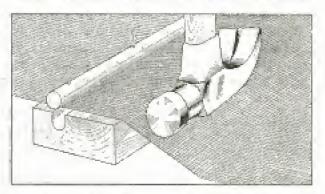

A Spur Gear Used as an Adjustment in the Coupling Driving a Magneto

drill rod being used as a rivet. The old ball-bearing housing was then rebored to fit the water-pump shaft, while the other inside diameter just happened to fit the outside diameter of the gear. Four holes were drilled, evenly spaced as shown, and tapped for four setscrews. The housing was then riveted to the shaft, the same as the spur gear. The setscrews serve as a connection between the two members of the coupling. The relative position of the two parts is varied by merely unscrewing the setscrews and turning the gear as desired. A small leather cover was provided for the complete coupling, to protect it from the grit and dust.—Contributed by Adolph Kline, New York City.

Stretching Window Screens on Frames

The screen wire is first fastened along one side with tacks, then this edge of the frame is placed against

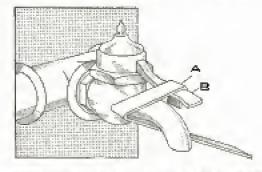

Stretching Window-Screen Wire on Frames with the Use of the Hammer Head

some support while it lies on the bench top or table. The screen is then stretched with the hammer head placed on the extending end of the screen and pressed down in the successive positions as shown. The screen will stay taut after removing the hammer, as the bend will hold it while the tacks are driven.—Contributed by E. K. Marshall, Oak Park, Ill.

A Faucet Lever

Upon a self-closing faucet I attached a piece of band iron, A, bent as shown and hooked over the faucet lever B and under the spout. The shape of the angle was such that if the lever was raised by taking hold of it at the end, it would pull down the faucet lever B, allowing the water to

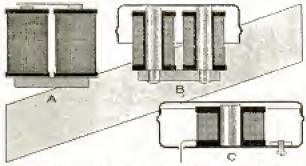

An Extra Lever Attachment for a Self-Closing Faucet to Hold It Open

run as long as desired. Pushing the iron back closed the faucet.—Contributed by R. F. Pohle, Lynn, Mass.

Buzzers without Contacts

How often a person sees the inscription "60 cycles" on alternating-current motors without stopping to think what it means. Nine people out of ten will underestimate the duration of time designated as a second, so that it is safe to presume that very few have any adequate conception of 60 cycles per second. The buzzers about to be

Three Types of Buzzers without Any Moving Parts for Use on Alternating-Current Lines

described will furnish direct and positive evidence to the ears, and will demonstrate, where an alternating current is available, that make-andbreak contacts, with their liability to get out of adjustment and become corroded, are quite unnecessary. small bell-ringing transformer, operating directly on the commercial lighting circuit, is largely replacing batteries as a source of power for bell and annunciator systems, and it is very natural that such should be the case, because the results are more positive, and the expense in the end less than that occasioned by the constant replacing of exhausted cells. While the small transformer greatly reduces the voltage, it does not, of course, affect the alternations or their frequency; hence, all that would appear necessary in order to make a buzzer, would be to provide a suitable armature and a coil with an iron core.

Simple though this may appear, in carrying out the idea in actual practice one is apt to learn several things about the subject of vibration. As a simple initial experiment, provide a coil with an iron core, and if the resistance is not 50 ohms or more, so that it may be connected directly across the 110-volt

circuit, connect it up in series with a small water rheostat. Clamp a strip of steel—an old hack-saw blade will do-in a vise and bring the coil near, having previously arranged a piece of board on which to place it. Vary the length of the spring projecting from the vise and note that there is just one length, about 2 in., for which the vibration will reach a maximum. It may also be noted that by shortening up the spring beyond this point, it may again be brought into phase by adding a small weight near the end. As 60 cycles means 60 reversals of the current per second it will cause 120 distinct magnetizations of the iron core, and when the spring is freely vibrating it is doing so at that rate. To furnish a comparison it may be stated that the middle "C" on the piano vibrates about 256 times per second.

immediately suggests simple form of buzzer indicated by the diagram A. Lay a piece of spring steel, or even tin, across the poles of a magnet and solder one end to one of the poles, which may be more easily done if a small hole is drilled in the spring at that point. With the edge of a knife slightly raise the other end barely the thickness of a sheet of paper, and the buzzer is complete. If the distance of the spring away from the pole is small enough, so as to cause it to hit the pole at each vibration, the tuning will be perfect.

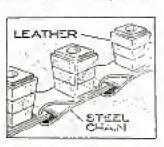

In the buzzer B, the sound is considerably increased by replacing the spring with a small tin box, from 1½ to 2 in. in diameter. After the solder sets, be sure to do no more than just pry the tin loose from the other pole.

In the diagram C is shown a buzzer that has a decidedly commercial appearance, as it is completely self-contained within a small tin box, such as used for shoe polish. The soft-iron core in the center should be just long enough to reach from the bottom to the cover. File it off squarely and solder it to the bottom. Slip the cold on, and if it fits loosely, fasten it with shellac and paper packing. Ground one wire to the tin, and solder a small

battery nut on the inside so that a connection can be readily made. The other wire may be let out through a hole. Put on the top and adjust it until a good loud buzz is secured, and then fasten it with a drop of solder. Test it again, and add a second drop of solder, about one-third of the way around. If the buzz still remains loud and clear, the addition of a drop of solder at a third point will settle the matter. It will be evident that as the buzzer is dust-proof and has no moving parts to get out of order, it should last indefinitely.—Contributed by John D. Adams, Phoenix, Ariz.

Homemade Belts for a Cyclecar

The V-chains, or belts, on my cyclecar wore out, and I constructed two

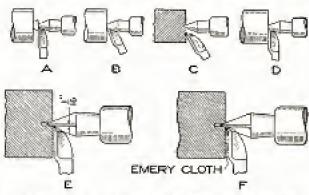

chains that gave good satisfaction, in the following manner:
I procured enough galvanized-steel chain to extend around the pulleys, then

from the nearest cobbler I procured enough scrap leather to make V-blocks for the links. The leather was put to soak, then cut into small pieces, and a hole was punched in the center of each piece for a rivet. The pieces were built up on a rivet to the desired thickness, and then they were cut to form a V-shape to fit the groove of the pulleys. For every link in the chain, a leather block was made and riveted to the link, as shown in the illustration.—Contributed by B. O. Bates, Campbellton, Can.

A Center to Face and Polish in a Lathe

It often happens that amateurs, and sometimes even skilled workmen, have the troubles shown in the illustration when facing the ends of shafts in a lathe. In taking a roughing cut, more metal is removed than the depth of the center hole in the work, as shown at

A. At B is shown a tool set over at such an angle that it leaves tool marks, as exaggeratedly illustrated at

Center with a Cut-Out for the Tool in Facing and Polishing Work in a Lathe

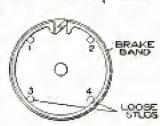

C. If the tool is set as shown at D, the angle on the tool is too blunt at the point to fit into the space between the work and the lathe center, so that a burr is left similar to the one shown at A.

A good way to overcome or avoid these troubles is to use a center, as shown at E and F. A regular center is ground, or milled, to within about ½6 in. of the center point. This will allow the point of the tool to enter the center, and it will face the work smooth; besides, the work may be very easily polished by folding a piece of emery cloth, holding it between the tool and the work, and pressing it against the tooled face by means of the lathe carriage while the work is revolving.—Contributed by Geo. M. Jager, Irvington, N. J.

Repairing an Automobile Brake

The internal expanding brake on a certain automobile gave trouble, and finally the car had to be laid up while

repairs were made. In action the brake did not respond as quickly as it should, and when it did take hold it was so sud-

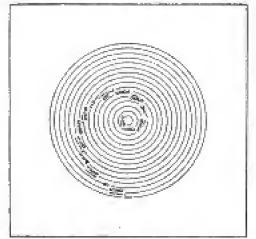

denly and so hard that the wheels slipped. An examination revealed nothing very wrong except that two

of the four studs, or posts, that spaced the brake band were loose. When new ones were made, driven in tightly, and riveted, the trouble ceased. These two loose studs let the band rise to the top when the cam was turned, and after considerable travel of the brake rod, the slack was taken up suddenly and so hard that it resulted in the slipping of the wheels,

An Aid in Drawing Fillet Lines

One of the most tedious operations in layout or detail work in a drawing room is the filling in of the lines of

Any Circle Set on Two Intersecting Lines Locates the Center for Drawing Fillet Lines

fillets, or arcs, tangent to two or more lines. The usual way of measuring the distance between points of the compass and then trying to strike the right center is slow and tedious. A simple contrivance for finding this center can be made as follows:

Procure a piece of transparent celluloid, about 3 in, square. Set the points of a pair of dividers $\frac{1}{10}$ in apart, and with one point as a center, set it as near the center of the celluloid as possible and strike a circle, scratching the celluloid so that the circle can be plainly seen. Then with a 1/8-in. radius and the same center strike another circle. Make similar circles, increasing the radius by $\frac{1}{10}$ in., up to 1 in., or larger, if required. Prick a hole through the celluloid with the divider point at the common center. Scratch the radius length in figures on each circle, as shown.

If, for instance, it is necessary to draw a full-size 7/6-in, are between two intersecting lines, lay the celluloid on the drawing, placing the circle marked 7/16 in tangent to the two lines for the arc. Run the marker through the center hole until it pricks the paper sufficiently to be seen when the celluloid is removed. This point will be the exact center of the arc, and a compass, spaced to 1/10 in., will draw the arc correctly. It is not necessary, however, to space the compass on the rule, as the center is found and the spacing can be done directly from the drawing.-Contributed by W. A. Scranton, Detroit, Mich.

How to Mix the Electrolyte for Lead Storage Batteries

The electrolyte used in the various types of lead batteries consists of a mixture of pure sulphuric acid and pure rain, or distilled, water. Sulphoric acid, when concentrated, is a liquid having a specific gravity of about 1.835; that is, it is about 1.835 times as heavy as water. It is customary to carry all gravity readings out to three decimal places, and the gravity of water, which is 1, is written 1,000 and read 1,000 rather than 1. Then, by this reading, pure sulphuric acid has a specific gravity of 1,835. A lead storage battery will not operate with acid of this strength, and it is necessary to dilute it with water. The electrolyte should be mixed, preferably, in a large jar, or lead-lined tank, and the acid must always be poured into the water while stirring the solution vigorously. In the operation of the storage battery the specific gravity of the electrolyte reaches a maximum of 1,250 to 1,300 when the cells are fully charged, and drops from 100 to 150 points when the cells are discharged. The lower and upper working limits of the gravity of the acid may then be assumed as 1,100 and 1,300, respectively. The following table may be used in determining the parts of water both by weight and volume, and the percentage of acid to

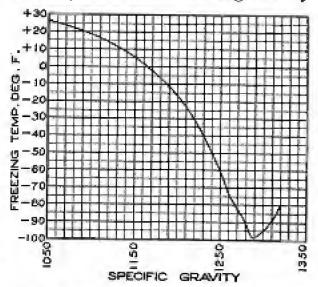

water to produce the different gravities. The results in this table are based on the sulphuric acid having a specific gravity of 1,835 at 70° Fahrenheit.

The electrolyte used in the storage battery expands when heated, and its specific gravity will change, although the actual strength of the solution will remain the same as before heating. The gravity of the electrolyte will change approximately one point for each 3° change in the temperature on the Fahrenheit scale. For example, if the electrolyte has a specific gravity of 1,250 at 70° F. and its temperature has changed to 85° F., the increase in temperature will cause the electrolyte to expand and its gravity will decrease one point for each 3° rise in temperature, or the total decrease in this case will be five points and the gravity at 85° will be 1,245. Similarly, a decrease in temperature will result in an increase in gravity. As a matter of convenience 70° F. is considered the normal temperature and all corrections in gravity due to a change in temperature are made so as to give the value of the gravity at 70° Fahrenheit.

Specific Gravity of Solution 70° F,	Parts of Water to One Part Acid		Percentage of
	By Volume	By Weight	Sulphuric Acid in Solution

Parts of Water by Weight and Volume and the Percentage of Acid to Produce the Different Gravities

The temperature at which the electrolyte in the lead storage battery will freeze depends upon the specific gravity of the solution. The curve given in the sketch shows the approximate relation between specific gravity and freezing temperature. This curve, as well as the other relations given, is used by one of the leading battery

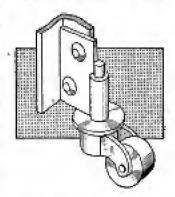

Curve Showing the Approximate Relation between Specific Gravity and Preezing Temperatures of the Electrolyte

manufacturers and may be considered, for practical purposes, fairly correct.

Attaching Casters to Angle-Iron Posts

The illustration shows a method of attaching casters to porch cots, or any

equipment constructed of angle iron, that must be moved from time to time, Many persons use cots of this construction on their sun, or sleeping, porches, and have had finely

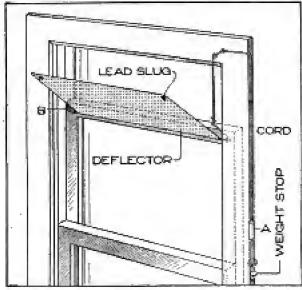

finished floors scratched and marred by the moving of the bed. The complete equipment is made up of two loose pin butts, using only the side with the double lugs, and is sawed in halves and riveted to the angle iron with the caster in place.—Contributed by W. D. Smith, San Francisco, Cal.

CUse turpentine instead of oil when drilling hard steel, saw plate, and the like.

Automatic Draft Deflector for a Window

An office clerk working at a desk to the right of which was a large window, on many occasions found it impractical, or uncomfortable, to raise the lower section of the window on account of the cold draft and for the sake of the

Deflector Attached to Upper Crosspiece of Top Sash and Operated by the Sash Movements

safety of the papers on the desk. It was also impractical to lower the upper section of the window, as the correct of air was directed downward with almost the same results.

The sketch is descriptive of an automatic deflector applied to the upper crosspiece in the top sash, in such a manner that when the section is lowered, the deflector automatically rises to an angle of 45°, and the air rushing through the opening is deflected upward, ventilating the room perfectly without any inconvenience to the occupants.

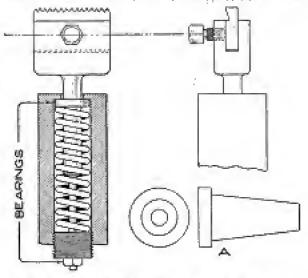

The deflector is made of a piece of canvas, stretched over a wire frame. As the window section is lowered, the weight A pulls the deflector up to a point where it is held at 45° by a small lug, or stop, B. As the window is lowered farther, the weight A is only pulled a trifle more in serving its purpose. When the top section is again raised, the weight A falls until it rests on the small stop or shelf, and

the loose string then lets the deflector drop flat against the window. Two small lead billets in the corners of the deflector aid it in dropping when the raising weight is lowered to its shelf. The weight A is a small piece of lead, which is not conspicuous, since it runs along the thin side of the casing. The canvas deflector can be painted the same color as that of the casing and sash, and does not give any unsightly appearance to the room.—Contributed by F. W. Bentley, Missouri Valley, Iowa.

A Threading Tool for Taper Work

The sketch illustrates a very handy tool for cutting threads on short tapers, shoulders, and the like. While the tool was designed for work similar to that shown at A, it is also good for straight work.

The casing, or body, is a steel block, drilled and tapped for a plug at one end, the plug having a bearing for the tool-holder end. In boring the casing, a small shoulder is left at the end opposite the plug, to afford a seat for a ring on the tool holder. This ring also provides a seat for a helical spring,

Tool for Use on a Lathe Not Provided with a Compound Rest, for Cutting Taper Threads.

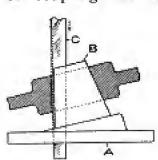

used to hold the cutting tool to the work, yet allows it to be forced away from the work when the pressure becomes too great, which occurs when the tool begins to remove more metal than is necessary to produce the thread. The cutting tool is simply a standard "chaser," used in every shop of any size

The pitch of the chaser, of course, must agree with the pitch of the thread to be cut, and the line of the teeth points must coincide with the taper of the work to be threaded, and, having been so set, it is only necessary to tighten the setscrew, set the tool for depth, and start the lathe just as in cutting any thread. The lathe, of course, must be geared for the same thread that the chaser is to cut, so that the feed of the lathe carriage may not conflict with the thread the chaser is cutting.

The work may be either chucked or carried on the centers, and the tool is clamped on the carriage, as it is too wide for the tool post. At the end of the cut, the feed is thrown off, and the tool quickly backed out by hand as usual. The spring arrangement takes the place of the compound rest in this class of thread-cutting.

To cut key seats in magneto gears, or couplings on automobiles, which

Cutting Key Seats in Taper Holes

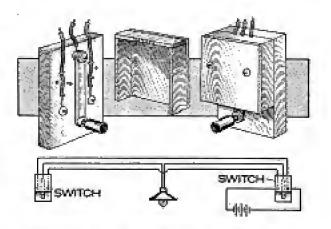

have a taper bore, is quite a task if not properly equipped for cutting them. The illustration shows a simple jig to, use with a tool similar to a

broach. The jig consists of a casting, A, with a steel plug, B, tapered to fit the work. One edge of B is set so that it will be perpendicular to the base, and a key scat is cut in it. A toothed drift, C, is made of tool steel to fit the key scat, and tapered along the teeth so that the upper ones extend far enough to give the proper depth to the keyway to be cut. It is only necessary to set the work on the plug B and drive the drift in the same as a broach.—Contributed by Allan J. Monahan.

Two-Way Switch for a Hall Light

A very handy contrivance for those using gas to illuminate a house is a small electric lamp to run on a battery, the lamp being operated with two switches, one placed just inside of the door and the other under the nearest gas light. This will allow a person to see the way clearly until the gas is lighted, when the electric lamp can be

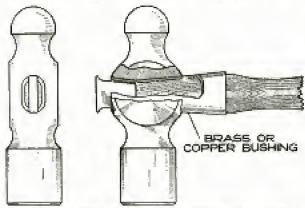

Operating an Electric Light in a Battery Circuit by Switches Located in Different Places

turned off without the trouble of returning to the door. For this purpose two-way switches must be used. They can be purchased cheaply, but are easily made by anyone at all handy with tools. The illustration shows the construction and scarcely needs a description. A small wood base, a piece of spring brass, a fiber, or wood, handle, and three screws are all that is necessary for one switch. The cover is in the form of a small box with one side removed, which can be fixed to the base with two screws. The wiring is shown in the diagram. The wires pass from the outside terminals of one switch to the outside terminals of the other. The center terminals connect directly to the lamp. The battery is connected to the two outside terminals of either switch. By this system of wiring, the lamp can be turned on or off at any time from either switch. The system is applicable to large rooms and basements where the gas light is some distance from the door.—Contributed by Morris G. Miller, New Rochelle, N. Y.

Reinforcing Hammer Handles

The illustration shows a method of bushing handles to prevent them from breaking at the eye of the hammer. The idea is one that will be appreciated by all machinists, toolmakers, and engineers that prefer tools of good ap-

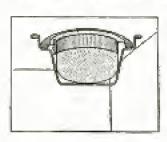

Bushing a Hammer Handle near the Head Where It Is Apt to Break Off

pearance and efficiency. Remove the handle from the head, and file the eye to the general shape shown, so that the bushing may be peened back to hold it in place. The front part of the eye is tapered uniform with the flat wedge, so that in driving the wedge into the end of the handle it also expands the bushing to the taper, and its sides force the wood of the handle and the soft bushing to the taper. This makes a neat and durable job, and adds much to the appearance of the hammer.

Hatrack for a Clothes Closet

Most clothes closets are built with a low ceiling, and do not provide suf-

ficient space for hat hangers, so that the hats are apt to fall when taking out the clothes. In such a closet I made racks of a single piece of wire,

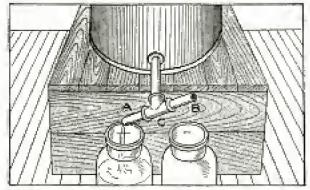

bent as shown and nailed to the ceiling of the closet. Hats placed on these racks are more secure from falling, while within as easy reach.—Contributed by J. V. Loeffler, Evansville, Ind.

Cleaning Steel of Burnt Oil

The oil, coming in contact with the surface of steel when hardening, will burn in places, and is hard to remove. The cleaning can be accomplished easily by immersing the hardened tool in gasoline, and when exposed to the air, it will dry immediately. This will leave the part to be polished without the marks of burnt oil.

Shifting Continuous Flow of Liquid without Loss

It is practically impossible to change cans under a flow of liquid without spilling some of it or at least having it run down the sides of one or both cans. The sketch shows an arrangement of fittings which will positively eliminate this trouble. The flow of liquid from the vat, or tank, is through a pipe leading to the place for filling the cans. On the end of this pipe a tee is fitted and nipples, A and B, turned into the tee openings. It is only necessary to

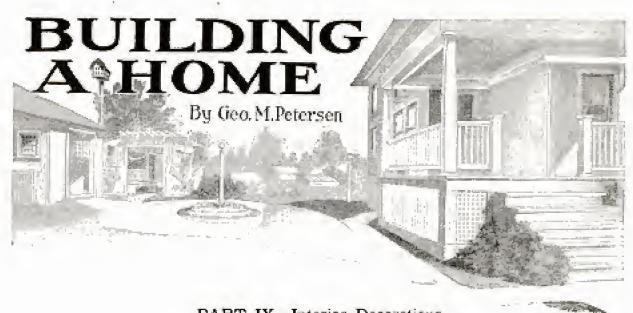

No Liquid can Escape in Turning the Tee from One Can to the Other

turn the tee C, to change the flow from one can to the other, and there will not be a drop of waste.—Contributed by Ralph E. Frizzell, Cleveland, Ohio.

Lathe-Center Lubricant

White lead and sperm oil, mixed together with just enough graphite to give it a dark color, make a good lubricant for lathe centers. This grease can be kept in a tin box, and oil added when necessary, to keep it from becoming too thick.

PART IX-Interior Decorations

O matter how artistically the interior of a home may be designed, how expensive the woodwork and floors, or how excellent the workmanship, it will never look right unless the decorations are in strict keeping with the interior finish. Many houses, finished by the contractor in a first-class manner, when turned over to the owner are spoiled by the latter by poor decorations, which reflect on the workmanship of the contractor when it is not his fault. As a rule, keep the decorations light, and do not make the mistake of selecting dark stains and wall papers or freak color schemes, as, they soon become tiresome to the eye.

The best way to obtain satisfactory results is to secure the services of some experienced decorator and have him make suggestions and submit figures. The cost may be too high, but the owner will benefit by the suggestions. If this course is not convenient, however, the builder might use the suggestions given in the following table to good advantage, changing the proposed color schemes to suit personal taste.

Of course, the color schemes of the various rooms must be such that those adjoining each other will appear well, and have a tendency to blend together when the doors are opened between them. It will be well for the inexperienced decorator to bear in mind that direct and positive contrasts are much more desirable than are poorly selected "matches" or "near-blends" that do not harmonize.

Rooms with only a moderate number of windows should never be decorated with dark paper or stain, and bedrooms should always be light and airy. As mentioned in the table the wall paper should be in light tints of yellow, pink, green, blue, certain shades of brown, etc.; plain colors, with a small flower pattern or a narrow vertical stripe. If a border is wanted, it should be only a

3 or 4-in. cut-out design, or a narrow band placed close to the ceiling. Any picture molding should be placed in the angle formed by the walls and ceiling. Dark colors in bedrooms are oppressive and for that reason should be avoided. Large, striking or peculiar figures should never be used in a bedroom.

Bathrooms are generally finished in white throughout. If a white tile floor is too expensive, the oak, or yellow-pine, floor may be finished natural, and the wainscot enameled white. The wall paper should be one of the glazed-tile designs with a plain white glazed

ceiling.

While genuine tiffany blends are a little expensive, they not only set off the room in which they are used, but also do away with redecorating for several years. Like most high-grade materials, tiffany blends will stand up for a considerably longer time than wall papers costing a few cents less a These blended effects also set off the furniture to advantage and harmonize well with any finish. Tiffany blends should be hung over a lining paper, which will protect the colors from the effect of any loose lime which may be in the plaster. Too much lime, or lime that is improperly slaked, will _ cause a multitude of little hair cracks on the surface of the finished plaster. Usually a coat of shellac varnish applied to the spot will protect the paper from becoming discolored, but the best method is to line the wall before putting on the paper, as the lime is very powerful and will work through the size which is put on the walls before any paper is hung.

Wall boards are being used quite extensively at the present time, and their use is practically unlimited. Wall boards are made of a wood fiber; not "trunk board," "press board," or so-called "waterproof" boards, which cannot be sized to take paint properly or are so permeated with grease that paint will not stick to them. Be sure to procure from the manufacturer or his agent a written guaranty that the board can be properly decorated, and

also samples of the board decorated as desired. These samples will not only show how the board takes the paint, but will serve as a guide in doing the work. The rich tones of flat colors, and the artistic "blended" and "stippled" effect, which may be obtained upon wall boards, are limited only by the decorator's artistic ability. Stenciled designs may be obtained at a very nominal cost, and are easily applied even by the inexperienced, There are a few points in connection with wall-board decoration, and the suggestions given, if carefully followed, will enable the owner easily to decorate his own wall board and save

considerable expense.

See that the board is properly cut, does not buckle or bulge, and that at least 1/8 in, is allowed between sheets. Apply a thin coat of wall-board primer, which is put up by all paint houses, using a little of the color selected for the finish. After the primer has set hard, the board may be painted in the usual manner, two coats being sufficient. If the board is to have a blended or stippled effect, the ground color is covered with a coat of blending color, applied before the ground color begins to dry. Blend the colors together, using a piece of cheesecloth, and giving it a circular motion. After the blending is completed and thoroughly dry, the stencils, if any are to be used, are put on in strict accordance with the accompanying instructions, care being taken to see that the panel strips, when applied, will not cut off part of the design. Leave plenty of edge around the stencil design so that it will show off to advantage and not appear crowded. The panel strips should be stained, shellacked, and varnished, and all panels decorated before putting the strips in place, as it is absolutely impossible to decorate a panel nicely with the strips fastened to the wall.

Finishing interior woodwork and floors is a very broad subject, and leaving out all "tricks" of the trade, a good job may be obtained if the work is done in accordance with the following suggestions: Upon the completion of the interior woodwork, and before any decorating is done, the surfaces of all wood parts to be stained, painted. or enameled, are lightly sanded, and all knots varnished with shellac. The surfaces are then given the priming coat, if paint is to be used. After the priming coat has hardened, any imperfections in the wood are filled with putty, using a wood spatula, as steel will mar the finished woodwork. The next step is to apply a second coat of paint mixed with turpentine and boiled linseed oil in equal quantities. The paint will dry out with a dull, or flat, surface, which will take the third coat properly. The third, or last, coat may be a regular ready-mixed "gloss" paint, or a prepared "flat" finish, as desired.

When enamel is to be used, the woodwork is usually given three coats of "flat white," the same as mentioned for the second coat in the preceding paragraph, and two coats of white enamel. The first coat of enamel should be lightly sanded before the second coat is applied. The finish coat may be left glossy, or may be rubbed with fine sandpaper or curled hair, to give it an "eggshell effect." Because of the great amount of work required to keep white-enameled woodwork clean, a number of first-class decorators are finishing the window sills, medicine-case doors, closet seats, and room White enamel doors in mahogany. and mahogany make a very pleasing and artistic combination, and the mahogany is naturally better adapted for places coming in contact frequently with the damp and soiled hands of The mahogany doors also set off the white-enamel trim to much better advantage than those having white surfaces.

Where interior woodwork is to be stained and varnished, the method of procedure is somewhat varied. If the material is oak, ash, chestnut, or any other open-grained wood, a coat of paste filler should be applied. Liquid fillers are often used, but are not, as a rule, satisfactory for the succeeding work. Paste fillers are applied with a

stiff brush and well rubbed in. After having set for about half an hour, the paste should be rubbed off with a handful of shavings, excelsior, or a rough cloth, rubbing across the grain and not with it. If the wood is to receive a stain, mix the filler with the stain. If the stain is applied to the wood and the filler afterward, it is very likely to produce small gray spots in the grain of the wood. Acid stains cannot be mixed with the filler. All putty work should be done after the filler has been wiped off and the work given a coat of shellac varnish. The putty is mixed with the color of the stain. Allow the shellac time to dry, and give the work a coat of good varnish. Do not use a cheap varnish, as it will dry with a too high gloss; will not cover as much surface or as well, and will not last as long. Never varnish in a damp room, as it will dry "tacky" or "sticky" and may never dry hard. The ideal place for drying varnish is a dry, warm room with plenty of sunlight. It may be well to mention that dark rooms should not be white-enameled, as the enamel will turn yellow in a short time. If a light stain will not do for the woodwork, it is better to use. a cream, or old-ivory, color and paint it.

If it is possible to stand the expense, have the first coat of varnish hand-rubbed, and a second coat flowed over it. Sometimes as many as seven coats of varnish are applied, each coat being "flatted" before the others are put on, but one or two-coat work is sufficient for medium-priced houses. The woodwork may be finished with shellac, if preferred, but at least three coats are necessary.

The "eggshell" or "dull-gloss" finish, so popular at present, cannot be obtained in cans, but must be handrubbed from gloss varnish, although a fair imitation may be obtained by mixing dull-gloss varnish and gloss varnish about half and half, as a large percentage of dull-gloss varnishes are too dull, and are worthless unless used over a gloss varnishe. The method of mixing the varnishes is very satisfactory.

Outside doors, window sills, and any

places exposed to direct and intense sunlight, should be protected with exterior, or spar, varnish, which will stand the effect of the rain and sun.

Close-grained woods, such as pine and whitewood, do not require any filler, the stain being thinned to the desired shade and put on like a wash. After the stain has had time to penetrate the pores of the wood, it is wiped off with a piece of waste, or a soft cloth. The grain will then show up much better than if the stain is allowed to dry in. The shellac and varnish are put on in the same manner as for opengrained woods.

The first thing to do in finishing floors is to have them properly scraped by the carpenter, or a regular floor scraper, preferably the latter, as they specialize in this kind of work and do it a great, deal cheaper than the average carpenter. No matter how carefully, or how well, a floor is laid, there are sure to be little imperfections which all the finishing possible will not efface, or cover up, and, therefore, they must

be scraped.

Floors are usually finished in natural oak, the lighter shades being the most popular, as they do not show the dust like the darker surfaces. After the floor has been properly scraped, it is filled, or stained, depending on the kind of wood, as mentioned for interior The floor may then be woodwork. shellacked, varnished, or waxed. If a semigloss finish is desired and shellac is used, the floor should be given about five coats of thin white, or orange, shel-Shellac stains, or discolors, the wood less than any other varnish, and has the additional merit of drying quickly and refinishing cheaply. When varnished floors are wanted, the woodwork is first given a thin coat of shellac over the stain, and then as many coats of varnish as desired. From one to three coats of good floor varnish is sufficient.

To produce a wax-floor surface properly, apply two thin coats of shellac varnish and then five, or more, coats of wax, thoroughly rubbed down and polished with a weighted brush, made especially for the purpose, between the coats. Each coat of wax should be allowed from five to seven days to harden before the following coat is

applied.

Do not make the mistake of trying to save money on floor wax by using beeswax cut with turpentine or alcohol. Beeswax is not floor wax, and it is unfit for this purpose. Floor wax is a compound manufactured especially for this work.

In remodeling an old house, the interior woodwork may be cleaned by burning off the old varnish with a blowtorch and using a scraper, or it may be removed by the application of varnish removers and a stiff brush. While the latter method is a trifle slower and a little more costly, it is the best, as the fire hazard is removed entirely, and there is no chance to have any scorched woodwork. All varnish removers are volatile and highly inflammable, and should never be used in a room in which there is a fire of any kind. Varnish removers are used almost exclusively for cleaning out molding, which would be almost impossible to do with a blowtorch, and for cleaning floors.

For cleaning old wax floors, a 10-percent solution of carbonate of soda is the finest thing known. The soda is dissolved in hot water and applied with a brush, after which the solution is wiped up and the floor thoroughly

rinsed with clean, cold water.

Locating Point on Planer Work to Set Pin Gauge

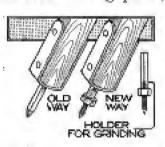

When pin gauges are used, mostly in large shops, on planer or boring-mill work, it is often a tedious job to find the point, exactly under the tool, where one wishes to face off the boss, or other elevation, to a certain height. To locate this point, squirt a few drops of oil on the tool, and where the oil drops will be the exact location for the lower end of the pin gauge. This appears to be very simple, but it saves a great deal of time.—Contributed by W. E. Butler, Wausaukee, Wis.

To Keep a Long Stencil from Sagging

Doing stencil work alone on walls and ceilings is a tedious job, especially when the stencil is 10 in, or more long. In brushing one end, the other end hangs down in the way, and there is also danger of smearing the work. A remedy for this is to tack a thin strip of wood to one side of the stencila yardstick is about the right size. This will hold the stencil flat to the wall and avoid all danger of smears. In making lines on ceilings, I alone have in this way handled stencils that were 3 ft. in length, and made a good job of it.—Contributed by Claude O. Soots, N. Salem, Ind.

Removable Spurs on Ladder Ends

Working as a beltman in a large manufacturing plant, I had considera-

ble trouble in keeping the spurs on my ladder sharp. The floors were of wood, and a great many times the spurs would strike

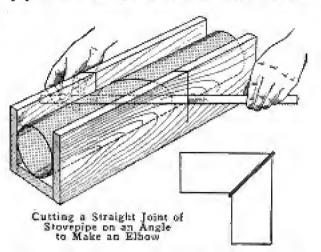

nails or pieces of metal on the floor, thus dulling the points. When dull, it was quite a task to remove and sharpen them. To overcome this difficulty I made the ends to hold a threaded spur, as shown. It is now very easy to remove the spur when it becomes dull, insert it in a holder, and grind a sharp point on it.—Contributed by William F. Gunn, Chicago, Ill.

Stiffening Thin Wall Board

If thin wall board, the cheap kind that is weak and flexible, is given a coat of filler and a coat of oil paint on each side, it will not only be preserved against warping, but will become decidedly stiffer and stronger. Painting on one side only does not prevent warping, and only slightly increases the strength.

To Make a Stovepipe Elbow

In a mining camp, far from a supply station, we received a lot of stovepipe, but there was not one elbow

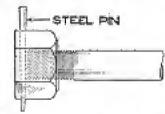

among them. To construct an elbow, which was badly needed, I made a box like a miter box, and cut a slot with a saw across the top, at a perfect 45-deg, angle. Then, with a hacksaw blade held in the hands, I sawed down through a straight length of pipe as shown. About ¼ in, of the stock on each slanting end was turned up like a flange. These flanged ends were set together to form the proper angle for the pipe, and then riveted, after which they were folded over to make the joint smoke-tight.—Contributed by W. A. Lane, El Paso, Tex.

Holding Threaded Studs in a Bolt Cutter

Short studs, or studs with only a small part left without threads, pre-

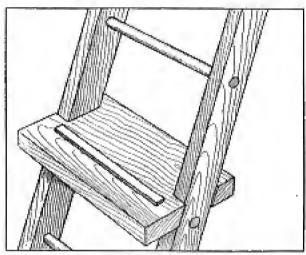

sent a problem for the bolt cutter. In a certain machine - repair shop the usual scheme was to u s e a locknut, or to let a nut

jam on the imperfect threads of the end first threaded. Both of these methods are crude and inefficient, as much time is lost in removing the stud. The following is an effective and simple solution of the difficulty. A hole, drilled through the base end of a nut as shown, is provided with a slightly tapered pin. The operation is evident. One end of the stud is threaded, the nut is placed in a vise, and the stud run up against the pin. After the threading, the pin is easily backed out by a slight rap and the stud removed with the fingers.

Flat Step for a Round-Rung Ladder

One who is not accustomed to painting, finds that the rungs of the ladder soon make the feet tired. This may

Flat Step to Fit on Ladder Rung, to Prevent the Feet from Becoming Tired

be prevented by procuring a plank, 1½ in. thick, 8 in. wide, and as long as the width of the ladder, and cutting notches in the ends to fit the sides of the ladder, for a step. Nail a small strip on the step, as shown, to keep the feet from slipping. The plank can be changed from rung to rung as desired.—Contributed by W. S. Drace, Richmond, Mo.

Heating Tips of Tools for Hardening

When it is necessary to heat the tips of tools to harden or anneal them, use a raw potato to prevent any other part of the tool from heating, as follows: Stick the tool through the potato, leaving only the portion to be worked projecting, and the heat will reach only the exposed part.

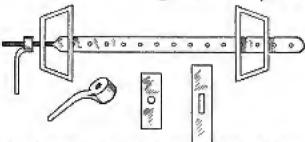

Using a Large Planer for a Press

Sometime ago we had several steel tubes, about 5 in. in diameter and 4 ft. long, which had to be a press fit over the piston rods they were to cover. Not having a press large enough to handle the job, we were stuck until the following idea was hit upon. There was about .003 in. left for a force fit. Both ends of each tube were capped and live steam turned into them, which enlarged them about the amount mentioned.

The rods were bolted upon the platen of a 36 by 36-in. planer, and a solid back stop was erected just far enough away to allow for starting the tube. When all was ready, the steam was turned off, the caps removed, and the tube lifted in position and shoved on by hand for about 8 in., when it began to go hard; then the planer was started very slowly, which pushed the tube home without further trouble. The whole scheme worked out very nicely and without much trouble or outlay.—Contributed by A. Dane, Pottstown, Pa.

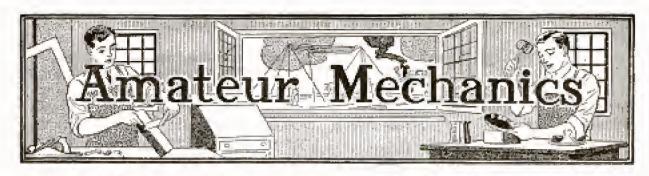

A Carpenter's Clamp

The clamp illustrated is quite handy, as it can be made adjustable for almost any size of work. The bar is of coldrolled steel, 6 ft. long, 2 in. wide, and ½ in. thick, with one end forged into a round shank and threaded. Two dogs are used on the bar, one adjustable for any position with the aid of holes through which a pin is inserted in the bar. The other dog travels only the

One Dog can be Set at Any Position within the Limits of the Bar, and the Other Used for Clamping

distance of the threads on the shank by the use of the handle.—Contributed by H. J. Olsen, Hibbing, Minn.

Measuring Resistance with a Lead Pencil

BY JOHN D. ADAMS 7

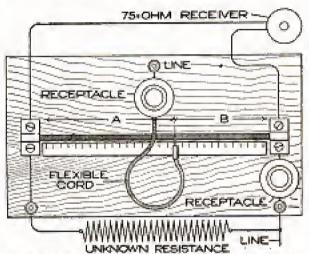

THERE are very few electrical experimenters who can afford a Wheatstone bridge for measuring resistances, and yet, if one is to gain any knowledge from his experiments, it is very necessary to know what resistance is being used, particularly in handling 110 volts. The amateur will find the following method very useful.

There are several brands of lead pencils, the leads of which have a resistance of 200 to 300 ohms, while others have comparatively little resistance. Soak several pencils—preferably the large kind carpenters use-in water over night so that the leads may be removed without breaking. Connect up two 40-watt lamps in series and note how they burn. Then replace one lamp with a lead and note the relative intensity with which the remaining lamp burns. If the lead is of a sufficiently high resistance it will cut down the illumination about as much as the additional lamp.

Having selected a lead, mount it on a suitable board, holding it in place by clamping each end under a strip of brass held down with wood screws. Next screw in place two porcelain receptacles and place three binding posts in position, all as shown in the sketch. Connect up as indicated, and attach a short length of flexible cord, with a metal tip on the free end, to one terminal of the central receptacle. Procure a cheap 75-ohm receiver and connect it to the two ends of the pencil lead. Finally glue on a paper scale.

To operate, place a high-resistance lamp in the center receptacle—say, a 15-watt lamp—to prevent heating, and almost any lamp of known wattage in the other receptacle. From the rating

of this lamp the resistance may at office be determined by Ohm's law. Thus, at 110 volts, a 25-watt lamp will have a resistance of 484 ohms; a 40-watt

The Lead Taken from a Lead Pencil and Used as a Means of Measuring Resistance

lamp 300 ohms, and a 60-watt lamp, 200 ohms. Connect the unknown resistance, as shown in the drawing, and move the metal tip on the end of the flexible cord back and forth along the pencil lead until a point is reached where no sound is emitted by the receiver. This point will be very well defined, and as the connection is moved away from it in either direction the sound will increase rapidly. Note the reading on the scale, and then if a 40-watt lamp is used in the end receptacle, the unknown resistance will be $=\frac{300 \text{ A}}{D}$.

The resistance of the center lamp does not enter into the computation, but by changing the lamp in the end receptacle, another set of figures may be obtained, and a means had to secure increased accuracy.

A High Chair

Where a high chair is not at hand or available, an ordinary solid-bottom kitchen chair can be used instead, if

An Inverted Solid-Bottom Chair with Attachments Used for a Child's High Chair

rigged up as shown in the illustration. The chair is reversed, and the back is used as one support, while two pieces of wood fastened to the sides form the other. A seat board is fastened to the upper side rounds, and a table board to the two lower side rounds. A small piece is nailed to the two back posts for a back.—Contributed by J. S. Fritzen, Minneapolis, Minn.

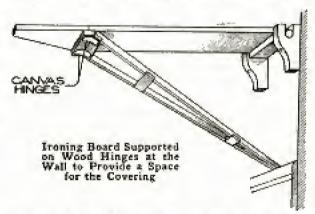

Blower for a Fireplace

Having considerable trouble with a smoky fireplace when trying to start a coal fire in the basket grate, I decided to make a blower of sheet iron. A

blower covers the upper part of the fireplace and forces the draft through the basket grate until the fire gets a good start, then it can be removed. Before making the blower I again had trouble one morning when the chimney would not draw, and the whole room became filled with smoke; I then grabbed a newspaper and held it up against the upper part of the fireplace like a regular blower. To my surprise the suction of the chimney held the newspaper in place without any outside aid. In a few minutes the fire was roaring, and best of all, when it became hot, the newspaper caught fire and was sucked into the flames. This in reality became an automatic blower, as it removed itself when no longer needed.—Contributed by Charles F. Kopp, Amite, La.

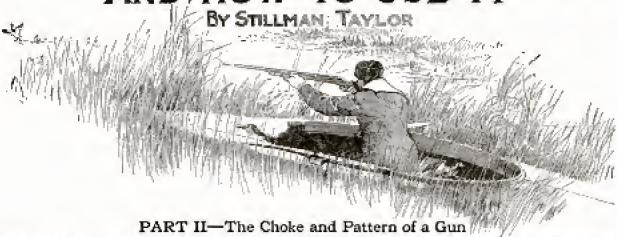

An Ironing-Board Wall Fastening

One of the most useful and convenient articles for a household is an ironing board, one end of which is fastened to the wall by means of hinges to allow it to be folded up against the wall when not in use. Wood brackets are preferable to the metal hinges, as there must be some little space between the wall and the board to allow for the thickness of the covering. The brace which extends from near the end of the board to the base of the wall is best hinged with canvas strips, as they will last better than any other material for this joint. The hinges should be put in place when the board is in a vertical

position to allow the brace to go in position without straining.—Contribated by J. H. Beebee, Rochester, N. Y.

THE SHOTGUN AND HOW TO USE IT

HAVING picked out a gun that "fits the man," the matter of choke and pattern should be considered. For trap shooting and for wild fowling, the full-choke gun may be considered a necessity, since it will throw the charge of shot within a relatively small circle; in other words, make a denser pattern. Chokeboring is accomplished by constricting the barrel at the muzzle from $\frac{1}{25}$ to $\frac{1}{50}$. in., the amount of taper depending on the size of the bore and gauge. The narrowing of the muzzle forces the charge of shot together and prevents the pellets from scattering over a wide area. Guns are bored with varying degrees of choke, from the full to the plain cylinder, and the manufacturers compare them by recording the number of pellets which any given choke will shoot in a 30-in, circle at 30 yd., or any other range selected as the maximum distance. This gives the pattern from which we find that the full choke produces 70 per cent, the half choke 60 per cent, the quarter choke 50 per cent, and the cylinder 30 per cent.

For trap shooting and wild fowling the expert considers it essential that his 12-gauge should be capable of throwing not less than 300 pellets; hence he selects a full-choked gun with a pattern of 300 or better. As a full-choked 16-gauge will pattern about 275, it may be used for ducks with good success. For a general-purpose gun, a pattern from 250 to 275 will prove quite

satisfactory for ducks and upland game, and this may be had by picking out a half-choked 12-gauge, or selecting a full-choked 16-gauge. The 20gauge gives a pattern of about 245 shot, and thus scatters its charge over too large a circle to prove effective on wild fowl, although it is very effective on upland game, which is flushed not over 35 yd. from the shooter. A gun patterning from 225 to 250 may be considered the ideal upland gun, and this may be had by choosing a quarterchoked 12-gauge, a half-choked 16gauge, or a full-choked 20-gauge gun. These are known as "open-choked" guns, are the most effective at short ranges, up to 35 yd., and cannot be depended upon to kill clean when used at longer ranges.

Shooting with Both Eyes Open

To handle the weapon well is the desire of every sportsman, and this knack is not difficult to attain, providing the novice will make a good beginning. First of all, it is necessary to hold the gun correctly, and while the forward hand may grip the fore end at any convenient point, a well extended arm gives a better control of the gun when aiming, by giving free play to all the muscles of the arm; hence the gun should be held in a manner natural to the shooter, rather than in imitation of the style of another.

The old manner of aiming the shotgun by closing one eye and sighting

along the rib is fast becoming obsolete, for better shooting may be done by keeping both eyes open. Doctor Carter was the first great exponent of binocular shooting, and while but few men can hope to approach this famous gunner's skill, every one can learn to handle a shotgun more quickly and with greater accuracy by following his common-sense method. It may appear a bit strange at first to disregard the sights and keep both eyes open, and aim the gun by merely pointing it in the desired direction, but to sight along the rib and attempt to see the bead on the muzzle end can only make a slow and poky shot. This old-fashioned method may be good enough for making patterns on a stationary target, but it is not much of a success for wing shooting. For fine rifle shooting the left eye is invariably closed for target work, but for snap-shooting both eyes are kept open, the sights are disregarded, and the aim is taken by pointing the gun at the object to be hit. Of course, there are many good gunners who shoot with one eye closed, but the novice who is auxious to become a good wing shot should make it a point to practice with both Vision is always clearer, eyes open. and the objects more accurately judged with both eyes open than with one, and when this is done, and one eye controls the line of aim, the shooter is not so likely to make mistakes in estimating the distances and the rapidity of the flight of his game. In shooting, the right eye naturally governs the right shoulder, and vice versa, and this is so because habit has trained the eye to do this. To find which is the master eye, hold a pencil out at arm's length and point it at some small distant object with both eyes open, then close the left eye, and if the pencil still points to the object, the right eye controls the vision, and is the master eye. Should the closing of the left eye alter the aim, the right eye must be trained by practice until it becomes the master eye, or else the gun must be shot from the left shoulder, which is many times more difficult. The modern way of

mastering wing shooting is to point the gun where both eyes are looking, and after a little practice this may be done quickly, and the charge thrown more accurately at the object than by closing one eye, or sighting along the barrel in the old manner.

The Knack of Hitting a Flying Target

When shooting at clay targets, or at a flying bird, allowance must be made for the swiftness of flight and the distance from the shooter to the game, or in other words, the shooter must calculate the speed of the flying target and allow the probable time it will take for the shot to reach its mark. To make a quick snap shot at the flying target, the gun may be directly thrown at the mark and discharged as quickly as possible, or the gun may cover the mark and be quickly swung ahead and the charge sent at the point where the swiftly moving bird will be found when the shot gets there. Snapshooting is only possible when the birds are flying straight away or quartering, and as the shooter fires pointblank at the rapidly moving bird, the shot must be delivered so rapidly that only a very quick and responsive trigger and a fast man back of it can hope to score even a fair percentage of hits. A more certain way of aiming a snap shot is to throw up the barrel below the bird, then rapidly swing it to the proper elevation ahead of the moving target, and throw the shot at the point where the line of the aim and the flight of the bird intersect. For shots at quail, woodcock, and partridge in the brush, the quick snap shot often must be taken, regardless of the chances of missing, for to delay even a second will lose the bird. When a bird rises near the shooter, no allowance of lead or elevation are required, and the charge is thrown directly at the bird.

The rapid swing, however, is the most accurate manner of using the shotgun, at all angles and at any distance within the killing zone of the weapon. To make this shot, the gun must be thrown up behind the bird and

then rapidly swung ahead of it, throwing the charge without checking the swing of the arm. In this style of snapshooting, the elevation of the gun must be identical with the flight of the bird, inasmuch as the gun follows it, and if

the gun is swung about three times as fast as the bird is traveling, plenty of allowance for the time necessary to press the trigger and deliver the shot at the determined point will be made.

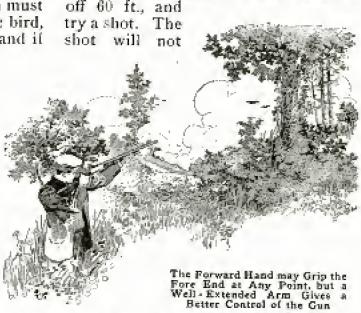

To swing deliberately and cover the bird with the sight, then shove the gun ahead to give the proper lead, is all right for duck shooting where the game is usually seen approaching and thus remains within range for a longer time. But this deliberate style of hand-

ling the gun is far too slow for the uplands, and since the rapid swing is the only accurate manner of cutting down the fast bird, and usually useful for wild fowling, the novice should confine his practice to this practical style of wing shooting.

Stationary-Target Practice

The first great mistake the novice is likely to make is the natural one of supposing that he must take his gun to the field and learn how to handle it by practicing at flying game. This is by no means the best method, and there is scarcely a poorer way of becoming a wing shot, because the gunner is intent upon bagging the game and forgets to observe the many little points of gunnery, shooting high and low, and making the hundred and one mistakes of judgment he would not be guilty of when practicing at a stationary mark. Snap and wing shooting is the last word in shotgun handling, requiring quickness in throwing the gun, as well as a trained eye to calculate the distance from and the speed of the flying target. To acquire confidence in using the gun, begin by shooting at a A good target may be fixed mark. made by obtaining a dozen, or two, sheets of stout wrapping paper and

painting a 4-in, circle in the center of each sheet. Tack it up on a board fence, or on a board hung on a tree, measure

spread very much at this short range, and it will be an easy matter to determine the result of your skill in holding a dead-on to the large mark. To avoid flinching and other movements of the head and body, caused by the recoil, begin your first practicing with a light powder-and-shot charge, say, about 2 dr. of bulk measure, or its equivalent in smokeless, and 1/2 oz. of No. 8 or 9 shot. There is no advantage in using a heavier charge, and the recoil of the gun will appear much greater in deliberate shooting at a target than is likely to be felt during the excitement incidental to shooting in the field. A dozen shots at these targets will enable the gunner to make a good score by deliberate holding, and when this can be done without fluiching, snap and wing shooting may begin.

Snap and Wing Shooting

The object which the gunner should now strive for is to train the eye, hand, and gun to work in unison, and to do this, bring the gun quickly to the shoulder, point it to the mark, and press the trigger without stopping the upward and even swing of the harrels. At the first few trials some difficulty may be encountered with the pressing

SWING GUN ACROSS TARGET AS IN-DICATED BY ARROWS AND

SHOOT IN PASSING

of the trigger at the proper moment, but a little practice will soon tell how to time the shots. Note the phrase,

"press the trigger," for the trigger is not pulled by the forefinger alone, but rather pressed by clospractically every novice makes when in the field, although the error is likely to pass unnoticed when after game.

TARGETS ON EACH

As the gunner acquires proficiency in swinging the gun from side to side, try swing-

Train the Eye, Hand, and Gun to Work in Unison, by Bringing the Gun Quickly to the Shoulder, Pointing It at the Mark, and Pulling the Trigger without Stopping the Motion of the Barrels

ing both hands, the forward hand on the fore end pushing and closing, and the hand

grasping the stock being drawn back and squeezed at the same instant. This is easily done, but rather hard to picture. After a few trials with an empty gun, the novice will see the point, and also discover the fact that the recoil of the arm is much lessened by this

proper grip of the weapon.

Confine the first practice in snapshooting to throwing the gun to the shoulder, and when proficient in hitting the mark, try a snap shot by swinging the gun from the side, right to left and also left to right. Do not attempt to check the even swing of the gun, but rather let the barrels swing past the mark, concentrating the mind upon pressing the trigger the instant the line of aim covers the mark. Practice swinging slowly, and after being able to hit the mark with the center of the charge pretty regularly, increase the speed of the swing. In doing this, it will be discovered that the speed of pressing the trigger must also be increased to balance the speed of the moving barrel, and very likely it will be found that the natural tendency is to press the trigger a bit late. This is the common mistake which

ing the gun at different angles, changing the angle of the swing with each shot, from right to left and upward, at an oblique

angle upward, and so on, until it is possible to hit the mark with a fair certainty from a variety of angles. When trying out the several swings, one should always begin slowly and increase the speed of the swing as he becomes more expert, only making sure to shoot by calculation and not by guess. The manner of acquiring expertness sounds easy and is comparatively easy, and, as it is the backbone of snap-shooting, improvement will be rapid if the novice is willing to practice slowly and master each detail in turn. Do not make the mistake of overdoing the thing at the outset by shooting too long at a time. A box of 25 loads is ample for a day's practice, since it is not how much one shoots, but how well, that counts.

Snap-Shooting at Moving Targets

When the gunner has reached the point where he can hit the stationary target by swinging his gun both fast and slow, he has acquired better control of the weapon than many old shooters, and he is well prepared to take up snap-shooting at flying or moving targets. The access to a gun club

where clay birds may be shot at, will prove of much value, but this is not absolutely necessary, since tin cans, bits of brick, and bottles, thrown in the air at unknown angles by a companion, will afford the needed variety. Better than this is one of the inexpensive "hand traps" which project the regulation clay targets by means of a powerful spring worked by a trigger. One of the large powder manufacturers makes a trap of this kind, and a very good trap can be had for \$1.50. standard clay targets cost about \$2.50 a barrel of 500. Practice of this sort may be made a very interesting and highly instructive sport, providing the targets are projected from different and unexpected angles, thus simulating the many-angled flight of the live bird.

Value of Second Barrel in Shooting

The use of the second barrel should not be overlooked in practicing with the idea of becoming an all-around wing shot, for the second shot is often needed to kill a cripple, or bring down a bird which has been missed with the first shot. Two-shot practice should begin by placing two paper targets about 20 ft. apart, then shooting at the first one and continuing to swing the gun to cover the second target. Practice swinging from various angles as directed for the initial practice, increasing the speed of the swing as proficiency is gained, and fail not to profit by the mistakes which must inevitably occur to all who try to master the shotgun. After a reasonable amount of practice, conducted along these lines, the gunner may venture afield, and if his acquaintance includes an old seasoned sportsman who will point out the mistakes made, much may be learned regarding the knack of handling the gun, as well as relating to the haunts and habits of our wild game birds.

Cleaning and Care of the Gun

A good shotgun is a thoroughly reliable and dependable weapon, but as with all tools of the sportsman's craft,

the best results can only be had when the arm is in good condition. gun wisdom always to clean the weapon after a day's shooting, and the amateur should make it a positive rule never to put his gun away until it is cleaned. The sooner firearms are cleaned after the firing the better, and if cleaned before the burnt powder has had time to corrode the steel, much future trouble is saved. In cleaning the barrels, never rest the muzzle against the floor. If a rest is needed, use an old piece of carpet or a bundle of rags. Clean from the breech end only, as any slight dust, or burr, at the muzzle will greatly impair the shooting qualities of any firearm. Never use a wire-wheel scratchbrush, as it will scratch the polished steel; a soft brasswire cleaner is the only suitable implement for this work. There are several good cleaners to be had. For removing any rust deposits, a brass brush may be used, while for ordinary cleaning, plenty of cloth should be run through the barrels, taking care that it touches every part of the interior. This is easily done by rotating the cleaning rod as it is pushed through the barrel from the breech to the muzzle. When putting the gun away, the barrels should be stopped, at the breech and muzzle, with tightly fitting corks, or gun ropes may be run through the barrels after soaking them in some good oil. To prevent rusting, cover the metal, outside as well as inside the barrels, by smearing on a little heavy lubricating oil. Slip covers of chamois are often used to protect the stock and barrels before putting them in the leather case, but stout woolen covers are better, since chamois is likely to absorb more or less moisture.

The mechanism of a gun is not exactly complicated, but the novice had better leave well enough alone and not attempt to dismount the locks or tinker with the mechanism. The modern steel barrel is very hard and not easily dented, but if so injured, it is better to ship it to the factory for repairs than to trust it to the crude methods of the average gun repairman.

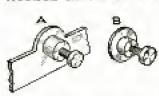

A gun should be given ordinary good care, and this is not forthcoming if one makes a practice of opening it and letting the barrels drop down with a bang. Snapping the triggers on an empty barrel is likewise foolish. If one desires to practice trigger pressing, put a couple of empty shells in the barrels.

If one owns a good-grade shotgun, the stock is probably finished in oil and hand-rubbed to a nice, durable polish. On cheap arms the varnish is usually employed to give an attractive finish in the store. Of course, this varnish will scratch, and otherwise come off,

and spoil the appearance of the arm. If a good finish is wanted, do not revarnish the stock, but remove all the old varnish by using a little varnish remover, and rub down with oil. For an extra-fine polish, wet the wood to raise the grain; rub down with very fine sandpaper; wet the wood again, and sandpaper a second or a third time; then rub down with oil until the wood is saturated with it, and polish with a cloth, using plenty of pressure, and the stock will be as fine in appearance as if it had the "London oil finish" supplied with all high-grade guns.

Brass Machine Screws with Nuts

When small brass machine screws and threaded nuts to fit them are needed in small devices, or for experi-

mental work, and the necessary taps and dies are not at hand, secure some old brass

globe holders and cut out the threaded hole for the nut. The fastening-screw arrangement on these will answer every purpose very well. Enough metal can be left on each one to fasten it on wood, as shown at A, or they can be cut, as shown at B, if they are to be soldered to metal.

Snapper-Shell Ash Tray

An odd and unusual ash tray can be

made from a snapping - turtle shell. Four brass, or wood, balls, or knobs, secured with screws, as shown, will keep it balanced. The exact points to

place the supports under the tray will have to be determined by experiment, as no two shells are of exactly the same shape.

A Portable Fire Screen

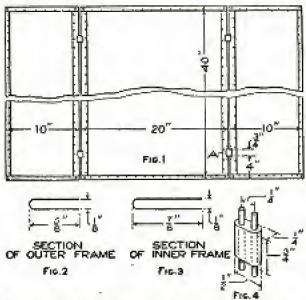

The fire screen illustrated can be constructed at very small expense. In brief, the screen consists of a light metal frame surrounding three pieces of ½-in, sheet asbestos. The frames inclosing the asbestos pieces are hinged together, as shown in Fig. 1, with special hinges made to meet the requirements,

The asbestos comes in sheets 40 in, square, and this size determines the outside dimensions of the screen. The size of the different sections can, of course, be changed if such a change will better suit the existing needs. By making the screen in sections it may be folded up and thus occupy much less space, and when in use, the sections, by placing them at an angle to each other, serve the purpose of legs, which would be required if the screen were in one straight piece.

The dimensions and form of the outer portions of the frame are given in Fig. 2, and those of the inner portions, or edges, where the hinges are attached, are given in Fig. 3. The joining edges of the frames are made wider than the others for the reason that some of the metal is cut away where the hinges are attached. These frames may be made from heavy tin or galvanized iron, and it will be a simple matter for a tinner to bend them into shape. After all these pieces are

bent, fit them together at the corners, making sure that they clamp tightly on the asbestos sheets, as these help to hold the frame in shape. Drill a small hole in each of the corners and provide a small round-head rivet of proper length for each of the holes. The vertical portions of the frame should be placed inside of the horizontal, or end, pieces at the corners.

Make four pieces of brass having the form and dimensions given in Fig. 4. Two 1/8-in, holes are drilled in each of these pieces as indicated. Slots are cut in the inner edges of the frames of such dimensions as will accommodate these brass pieces. The location of these slots is given in Fig. 1. Obtain eight pieces of 1/8-in, steel rod, about 2 in, long. Place the ends of the brass pieces in the slots in the inner frame and then put the rods through the holes in the ends of them and solder the ends of the rods to the inside of the frames. Make sure that there is no solder run in between the rod and piece of brass, as this will prevent the hinge from operating freely. After the hinges are in place, the frames are riveted together. Notches are cut in the edges of the asbestos sheets at the location of the hinges to allow the lat-

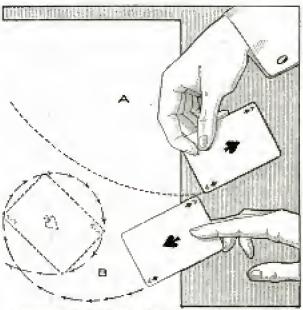

Pire Screen Made of Sheet Asbestos Inclosed in Thin Metal Frames Hinged Together

ter free movement. The sections of the screen may be made very rigid by placing a number of small rivets around the inner edges of the frame to hold it tightly against the ashestos. The asbestos may be given a coat of bronze, or be otherwise decorated for appearance.

Tossing a Card at a Mark Accurately

There is an interesting old game that can be played instead of solitaire. It consists in trying to toss the great-

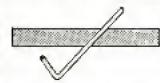

Tossing Cards Accurately so That They will Fall into a Receptable Set at a Distance

est number of cards into a small basket or an upturned stiff hat, set at a distance. If the cards are held as shown at A, and tossed as at B, they may be thrown with surprising accuracy.—Contributed by James M. Kane, Doylestown, Pa.

A Sanitary Drinking Tube

To make this tube, procure a piece of ¾-in, gauge glass, about 10 in, long,

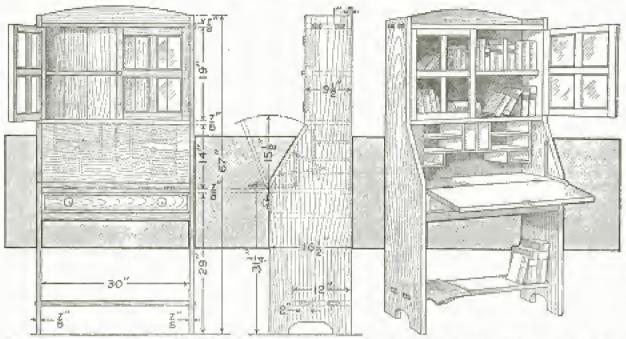

and hend it by heating the glass with a blowtorch 2½ in. from one end, as shown.

If this is done in a place where no air will strike the glass while it is heated and the tube is then allowed to cool slowly, it will not crack. It is used by putting the short end under the faucet and drawing on it as on a pipe.

Combination Bookcase and Writing Desk

In planning a writing desk, much convenience can be added by providing have this done by an experienced joiner, or in the mill. The back edges should be carefully planed, and rabbeted 3/8 in. deep by 1/2 in. wide for the 3/8-in. thick back. The bottom or foot piece of the

Combined Bookcase and Writing Desk Which can be Made Up in Golden Oak, Mission, or Mahoganized Birch, and will Appear Well with Other Furniture of Like Construction

it with a bookcase, in which may be stored those reference works most frequently used. The design illustrated furnishes ample room as a drawing desk, besides providing sufficient space in an inclosed cabinet for books or letter-filing cases,

The material required, figuring exact sizes, is as follows:

2 sides, 18 hs 1616 ws 57 in.
2 sides, 18 hs 16½ by 67 in.
1 bottom shelf, 36 by 12 by 32½ in.
1 top shelf, 18 by 9½ by 32½ in.
1 back, 36 by 40 by 31 in., made of pieces of convesions widths.
2 desk board, 16 by 16½ by 30 in.
1 lower bookcase shelf, 16 by 9½ by 30 in.
1 middle bookcase shelf, 16 by 8½ by 30 in.
1 desk cover, 36 by 15½ by 30 in.
1 upper back rail, 16 by 5 by 30 in.
1 hookcase Doors
4 stiles, 34 by 1½ by 19 in.

As the main sides are of considerable width, it would be best to make them of two pieces glued together and, in order to obtain a strong and neat joint, to

sides should be squared up with the back edges, or the completed desk is liable to be winding, or warped. bottom and top shelves or main cross braces should be marked and cut out. and, to be in harmony with the shape of the sides, the lower-shelf tenons are made wider than those on the upper shelf. The top shelf should be rabbeted ½ in, deep by 1/8 in, wide, to fit the back boards which are nailed to it. The required mortises in the sidepleces are marked from the corresponding tenons of the shelves, and can then be cut out with a chisel. When finished, the four parts constituting the frame should be assembled, and may be held together with blind screws, or dowel pins, passed through the tenons.

The desk board and two library shelves should then be fitted, and fastened in place with blind screws through the sides, or with cleats from the inside. For a neat, finished appearance, the back boards should be carefully joined, exposing no cracks, and fastened with nails driven into the various shelves. The upper rail, resting on the bookcase, and the lower rail, forming part of the drawer support, can then be fitted and secured to the sides with blind screws, either from the outside or diagonally through the rails from the inside. Drawer slides are fitted in place flush with the top edge of the lower rail, and fastened to the sides with screws.

In making the drawer, the usual construction should be followed. The front piece should be rabbeted near its lower edge to fit the drawer bottom, and notched ½ in at each end to fit the sides. The bottom and end pieces fit into grooves cut in the sides. Suitable drawer pulls or knobs should be provided.

For the doors of the bookcase, the best construction would be to tenon the rails into the stiles about ½ in. The glass panel fits in a notch, ½ in. deep and ¼ in. wide, cut around the inside edge of the door, and is held in position with molding strips. In order to give the door an appearance of being divided into four parts, mullions, or cross strips, are fitted on the outer side of the glass flush with the rails and stiles, and fastened to them with brads. The doors are attached with butt hinges.

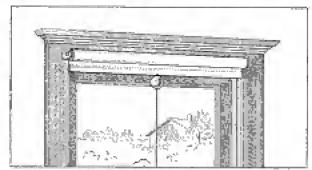

In making the desk door, a specially selected board should be used, as the finished appearance of the desk will greatly depend on this. The ends and sides should be perfectly squared, and the lower or hinge end cut beveled corresponding to the edge of the desk board. Butt hinges are used to secure it in position, and hinged brackets or chains provided to support it when open. When closed, it rests against a strip fastened to the lower side of the bottom bookcase shelf.

In arranging the pigeonholes it is best to have the inside boards rest on the desk board, so that, when desired, the entire arrangement of the drawers and shelves may be withdrawn easily.

When thoroughly sandpapered and finished to taste, a serviceable, handy and attractive piece of furniture is obtained, suitable for either office or home.—Contributed by James Gaffney, Chicago.

Automatic Stop for Spring-Roller Curtains

It frequently occurs, in adjusting spring-roller curtains, that the cord slips through the hand and the curtain not only winds up to the top but continues until the spring has spent its force, and the curtain and cord are

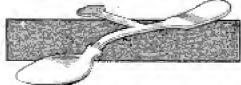

The Rubber Ball Fastened on the String at the Stick Prevents the Curtain from Winding Up

rolled up out of reach. It is then necessary to use a chair, or stepladder, to readjust it. All this trouble and annoyance can be avoided if a small hollow rubber ball is obtained, and holes punched through so it may be threaded on the curtain string, and tied close to the stick. Should the curtain slip away with this attachment, the ball will jam up against the window frame, preventing further winding up.—Contributed by T. B. Lambert, Chicago, III.

Spoon Attachment to Prevent Child from Using Left Hand

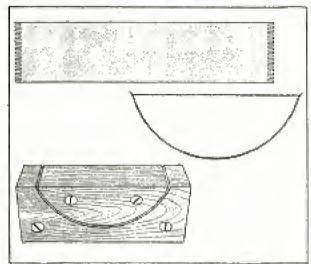

To discourage a child from using a spoon in the left hand, a projection was made of a piece of brass, filed into the shape shown in the illustration. After the projection was attached, the entire spoon was plated. This makes it impossible to use the spoon in the left hand, as the projection will prevent the

The Projection Reeps the Spoon from Entering the Mouth When Taken in the Left Hand bowl from entering the mouth.—Contributed by W. H. Hutchinson, Hamilton, Ont.

A Comb Cleaner

A very handy device for cleaning combs can be made from a piece of spring sheet brass, 4½ in, long and about 3 in, wide. Notches are cut in the ends of the brass with a hacksaw, making the projections as wide as the

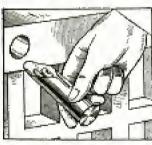

The Twisted Wires Form an Excellent Device for Cleaning a Comb

saw cut. The brass is then bent into shape with a special clamp made for the purpose, which consists of three pieces of wood, two being cut to form a curved slot, then fastened to the third piece. The brass is sprung into the slot, and then fine wire is stretched between the ends in the notches. The wire should be very fine and two strands twisted together and run through the notches.

Concealing the House Key

The time-honored custom of concealing the house key under the door

mat, or in the letter box, when the family has not enough keys to go around, is so well known that an unauthorized person seeking to enter

the house would look in these places first of all.

A simple and effective hiding place for the key can be quickly and easily made with the aid of an auger and two pieces of tin. Pick out an obscure section of the porch railing, and in the edge of this bore a ¾-in. hole, about ¼ in. deeper than the length of the key. Make a piece of tin into a cylinder, the same length as the key, so that the latter will slide easily into the bole. At one end of this cylinder solder a 1-in. disk of tin, which will make it appear as in the illustration.

If the key is placed in the cylinder and the latter pushed into the hole until it is flush with the surface, it will scarcely be noticed by anyone not in the secret, and by painting it the same color as the railing it will become still more inconspicuous.—Contributed by Frank L. Matter, Portland, Ore.

A Mysterious Watch

A very interesting experiment may be made with the ordinary dollar watch in illustrating the law of the

pendulum 39.1 in. long will make 60 one-way swings per minute, the number of swings varying inversely as the square root of the length. By actual count

it was found that the balance wheel of the watch in question made 240 oneway swings per minute, which is just 4 times as fast as the 39-in, pendulum. Therefore, according to the foregoing law, a pendulum 1/16 as long, or about 21/2 in., would swing in unison with the wheel of the watch. The question then arises as to what would happen if the watch itself were suspended so as to swing as a pendulum of the latter The experiment was made as length. illustrated, with the result that the watch keeps on swinging continuously. The swing amounts to about 3/8 in., and appears so vigorous that it is almost incomprehensible that the small spring in a watch should be able to maintain so much weight in continuous motion for 24 hours.

Surface Mining for Gold

By W. M. MILLS

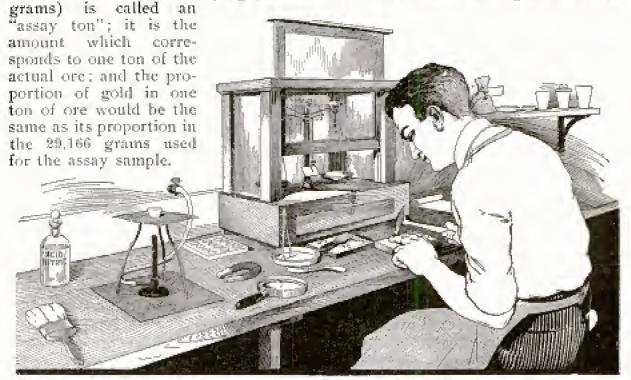

PART III - Assaying

N making a fire assay of gold, a more expensive and greater variety of tools is necessary than in the prospector's outfit or simple mining operations. Great accuracy must be used in weighing the small amount of gold found in a sample, or serious errors will result. It is, therefore, necessary to have a very delicate balance—capable of measuring _{20} \text{ milligram—for weighing tiny gold beads; a coarser set measuring to several ounces should be provided for weighing the crushed-ore sample and slag-forming ingredients. Besides these, there is needed a furnace, or forge, for melting the ore, and other equipment such as crucibles, cupels, ore grinder, and chemicals.

Weigh out approximately 30 grams —29,166 to be exact—or about one ounce of the ore. In the final weighing of the separated gold, every milligram weight will correspond to one ounce per ton of the ore. For example, if a bead of gold weighs 25 milligrams, then the ore value is 25 ounces troy of gold per ton of 2,000 lb. of ore. The amount of ore used in assaying (29,166)

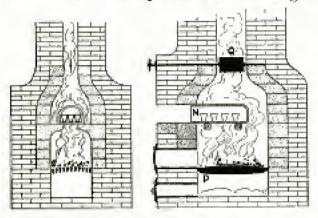

In order to form a proper composition with the gold-bearing ore, so it will readily fuse on the application of heat, certain chemicals and lead oxide, or litharge, must be added, which will combine with the ore, forming a molten The lead oxide is reduced to lead, and forms an alloy with the gold and silver which sinks to the bottom of the crucible as soon as boiling of the slag ceases. The necessary composition of the flux varies with the character of the ore. A general lead flux may be made as follows: Sodium bicarbonate and potassium carbonate, both four parts by weight; powdered borax, two parts, and flour, one part. To this flux is added litharge in amounts depending on the character of the gangue, or soil surrounding the gold. If this contains sulphides or sulphur, several iron nails are added and the flour is reduced; if the gangue is siliceous and acid, the flour is increased. No one composition will work equally well for all ores.

If an assay ton of ore—29.166 grams
—is to be used, a 20-gram crucible

The Tools Necessary for Making a Fire Assay of Gold Are Greater in Variety Than Those Used by the Prospector or for Simple Mining Operations

must be provided for the fusion. In practice the amount of ore is usually cut down to one-half assay ton, making possible the use of a 10-gram crucible. Where assays are run in large

An Especially Large Furnace is Required for Fusing the Charge Where Assays Run in Large Batches

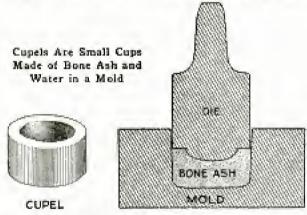

batches and one assay ton of ore is used in each, a specially large furnace would be required for fusing the charge.

When the mixture is made and combined with the finely ground ore, it is placed in a fire-clay crucible of suitable size, which is filled to about two-thirds of its capacity. The crucible and charge is now ready for the furnace. may be either open or "muffled," but must produce an intense heat; coal is, therefore, generally used. For want of anything better, an ordinary blacksmith's forge may be used, in which case the crucible should be put well down in the coals. A muffle furnace, as illustrated, is one in which the crucibles are placed in an inclosed fire-clay muffle, or oven, having an opening at one end only; the heat of the fire can only affect the crucibles and charge. The muffle, or oven, N, is usually about 9 in, wide by 15 in, deep. Its open end may be closed up by a fire-clay door in order to increase the heat. The fire is built on grates, P, the ashes falling into an ash pit, whence they are removed through the door. The intensity of burning is regulated by a damper, Q. Furnaces using gasoline for fuel instead of coal or coke are coming into favor rapidly, due to their compactness, light weight, portability, and ease of heat regulation.

The muffle should be red-hot before

placing the crucibles in it. The fusion, or melting, will require from 20 to 30 minutes, after which another 15 minutes should be allowed to form a good, fluid slag. If the boiling is too violent, a small amount of common salt may be added. If a charge has boiled over, the assay is not reliable and should be When the fusion is comrepeated. pleted, the crucibles should be removed from the furnace by means of a pair of long tongs, and the fused charge is then poured out on a piece of cold iron or metal mold, making sure that everything has been removed by tapping the crucible lightly. In cooling, the molten lead will settle to the bottom of the slag and may be easily separated This is now the from it when cold. lead button and contains all the gold and silver of the ore charge; it should be hammered into the shape of a cube and is then ready for the process of cupellation, which consists in evaporating and absorbing the lead in boneash cupels, the gold and silver remaining as a small bead.

Cupels are small shallow cups, usually about 11/4 in. diameter and 3/4 in. high. They are made by mixing fine

bone ash with water so it may be easily molded, then placed in a cupel mold and formed by several blows on the die. If a large number are to be made, cupel-stamping machines can be had which will turn out several hundred in an hour. The cupels should be dried for about a week before using.

The cupel should be heated red-hot before placing the button in it, after which they should be placed in the muffle with the opening closed until cupellation begins, which is indicated by the fumes of lead oxide given off. The door is then opened to increase oxidation of the button. This gradually disappears as the lead oxidizes and is absorbed by the bone ash. Cupeling requires about 40 minutes.

When it is nearly finished, bright colors play over the surface of the button, which will suddenly darken and then brighten again with a flash; cupellation is then complete, and the cupel should be withdrawn from the muffle and allowed to cool slowly, to prevent spitting, or bursting, of the bead. It may even be necessary to cover a large bead with a hot cupel in order that cooling may be slower.

During cupeling it is very necessary to keep the temperature as uniform as possible. If the temperature should become too low, the button will "freeze," that is, become covered with a film of lead oxide which prevents further oxidation, and even though it may be thawed by placing it in a hotter part of the muffle or by placing a piece of charcoal on top of it, the final

results are unreliable.

The cupel bead of gold and silver is then ready for weighing. It should be cleaned with a fine brush and carefully weighed on an accurate scale, registering to 1/20 of a milligram, or less. This weight is the total of silver and gold, and should be recorded as such. The two must then be parted so the true weight of each can be determined. The bead is put in a small porcelain crucible and covered with a solution of one-third chemically pure nitric acid and two-thirds distilled, or pure, water, gently warmed on a hot plate. Bubbles will be given off as the silver passes into solution; parting is complete when these cease. The gold remains as a black bead; the acid should be drained off, and the bead washed in several changes of water, and finally dried on blotting paper, after which it may be brightened by heat. The gold may then be weighed very carefully and this final reading subtracted from the total weight, the difference being the amount of silver in the ore. The weights are recorded in milligrams, each of which is representative of ounces in troy weight per ton of ore. If the original charge of ore in the crucible was less than one assay ton—or 29.166 milligrams—the

determination can
be made as iollows:
Weight of button in milligrams

- weight of ore in
assay ton or fraction there of

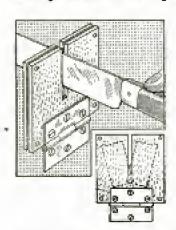

Parting the Silver from the Gold so That the Weight of Each may be Determined

troy ounces of gold per ton ore of 2,000 . lb. For example: it frequently occurs that only one-half assay ton of ore is used in the crucible; then, supposing the weight of the gold bead to be 1.5. milligrams, the value would be $1.5 \div$ $\frac{1}{2} = 3$ oz. per ton of ore; exactly the same as though one assay ton of ore had been used in the crucible and three milligrams of gold weighed in the balance. The money values of the gold and silver in ounces, as determined by weight, added together represent the value of the ore per ton, as assayed. If the gold assayed 1.5 milligrams per assay ton and its value were \$20 per ounce, it would mean a value of gold in the ore of 1.5×20 , or \$30. The value of the silver should be figured the same way, and the combined values would be the actual value of the ore per ton.

All assays and operations should be carefully recorded, not only for one's own benefit and habits of work but also for future reference. It is advisable to give all details of the assay, such as the owner, assay number, dates, values of all metals, and process followed.

A Table-Knife Sharpener

The knife sharpener shown can be easily made of two pieces of thin wood,

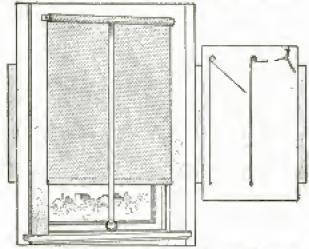

such as eigarbox covers, about 2 in, wide and 21/2 in. long, and two discarded safetyrazor blades of the heavier type. Lay the wood pieces together and saw a slot down the center for about 1% in. Lay the two

razor blades at an angle of about 2° on each side of the slot, as shown, fasten them to one of the boards, and securely attach the other board over them.

To sharpen a knife, run it through the slot two or three times. The sharpener can be fastened with a hinge so that it will swing inside of the drawer, or box, that the knives are kept in, and it will always be ready for use.—Contributed by Henry J. Marion, Pontiac, Mich.

Raising and Lowering Curtain at a Distance

To enable an invalid, or any other person, to easily raise and lower a cur-

A Ribbon or Tape Attached to a Curtain Roller to Operate It at a Distance

tain from a position at a distance from the window, a ribbon can be attached to the roller, at the center and on the inner side of the curtain. The ribbon may extend across the room in line with the window, and still operate the curtain as well as with the regular cord attached to the bottom. If desirable to operate the curtain by a vertical pull, a flat pulley may be conveniently fastened to the ceiling or wall, and the ribbon passed over it, or through a ring, as shown. This plan is especially adapted for show windows where the curtain string would otherwise mar the appearance, and be hard to get at.—Contributed by L. E. Turner, New York, N. Y.

The Mystic Climbing Ring

The performer hands out a wand for examination and borrows a finger

ring. He holds the wand in his hand, point upward, and drops the ring on it, then makes mesmeric passes over the wand with the other, and causes the ring to climb toward the top, stop at any place desired, pass

backward, and at last fall from the wand. The wand and ring are examined again by the audience.

To produce this little trick, the performer must first provide himself with a round, black stick, about 14 in. long, a piece of No. 60 black cotton thread, about 18 in. long, and a small bit of beeswax. Tie one end of the thread to the top button on the coat and to the free end stick the beeswax, which is stuck to the lower button until ready for the trick.

After the wand is returned, secretly stick the waxed end to the top of the wand, then drop the ring on it. Moving the wand slightly from oneself will cause the ring to move upward, and relaxing it causes the ring to fall. In the final stage remove the thread and hand out the wand for examination,

Dies for Cutting Cardboard

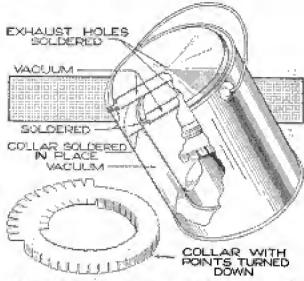

An inexpensive, yet very efficient, die for cutting quantities of tin foil, sheet lead, paper, and cardboard can be made from a steel rule such as used by printers. Procure a rule, two points or about with in thick, which comes in 2-ft. lengths. The rule can be readily bent without annealing. Bend it to the desired shape and solder, or weld, the ends together. To give it rigidity, fill in the space with melted lead to a depth of half the height of the die.

Place the material to be cut against the die and put both into a vise, or letter press. Apply pressure steadily until the die has cut through the last thickness of the material. As many as 25 pieces can be placed and cut at one time. When cutting designs for static machines, etc., from tin foil, this appliance does away with the tedious work of cutting one at a time, and then, too, they will all be uniform. In making the connection at the ends of the rule, be sure that they meet evenly and do not lap to make the joint.—Contributed by M. H. Granholt, Long Beach, Cal.

How to Make a Vacuum Pail

As a substitute for a vacuum bottle a very efficient pail can be made in the following manner: Procure a 1-galsirup pail for the outside and a 1/2-gal. size for the inside. Make a collar of tin, as shown, with projections; bend these down, inside and outside, then solder the collar to the inside of the larger pail, and the smaller pail to the inside of the collar. Be sure to make a perfectly air-tight joint in the soldering. This gives a double wall with an air-tight space all around the inner pail, or opening. To make vacuum covers for the pails, take two covers of each size and solder them together, as shown.

To produce a vacuum, make a small hole in the metal forming the collar, also one in each cover. Put a few drops of water in each vacuum compartment and set the parts on a heated surface. When the steam escapes, solder the holes. This will produce a partial vacuum in the space around the

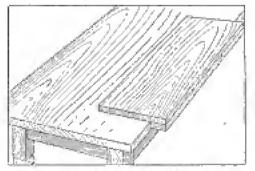

A Two-Wall Pail with Covers in Which a Partial Vacuum is Made

inner pail and in the covers. This will make a very efficient vacuum pail.— Contributed by John H. Spicer, Magnolia, Ark.

Ironing Board for Use on a Table

A handy ironing board for use on kitchen or dining-table top is made with a cleat to keep it from moving across the table top. The cleat, which is 1½ or 2 in. wide, is fastened to the board with screws. If desired, the board can be made as immovable as the table top by putting another cleat at one end, so that the two cleats will,

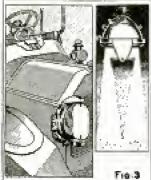

A Cleat Fastened to the Underside of an Ironing Board to Hold It on the Table Top

hold against one side and one edge of the table top.—Contributed by H. S. Craig, Rushford, Minn. 594

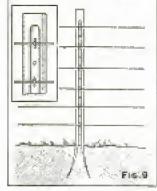

POPULAR MECHANICS

Fig. 1

INTERESTING NEW PATENTS

COMBINED ELECTROLIER AND TELE. PHONE COVER (Fig. 1)—The base of the electrolier is hollow and is made in the form of a receptacle for the telephone. It is equipped with two binged doors, so that the telephone is easily removed, or is entirely concealed when it is in the receptacle and the doors are closed.

METHOD OF REMOVING SNOW FROM CITY STREETS (Fig. 2)—The feature of this invention is the provision of ducts leading from the street to a sewer or other conduit, the snow being showeled down the sloping ducts at the sides. As the snow is shoveled into the sewer it is flushed away with water forced into the sewer through the pipes in the vertical conduit at the center.

DEFLECTOR AND DIMMER FOR AUTO-MOBILE HEADLIGHT (Fig. 3)—This simple device consists of an oblong plate pivoted vertically in front of the headlight. When the edge is turned toward the lamp a full light is thrown ahead, and when it is turned with the side toward the lamp, the light is dimmed. The light is thrown to either side of the road by turning the plate at an angle.

COMBINED SHOEHORN AND BUTTON HOOK (Fig. 4)—The hook is hinged to the horn near one end so that it is easily folded back out of the way or extended for use. Clips are provided for holding the hook in either position.

KNIFE SHARPENER (Fig. 5)—This device consists simply of a base, designed to be securely mounted on a table, on which is a standard split into two arms at the top. In recesses on the inner faces of the arms, near their junction, are mounted abrasive plates, and these are placed at such an angle that the proper angle is given to the edge of the blade when it is drawn between them,

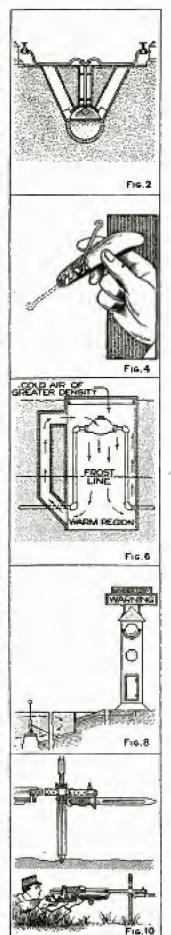

FROST-PROOF BOX FOR WATER PIPES (Fig. 6)—The feature of this box is the arrangement by which the air is kept in constant circulation so that the cold air at the top is constantly displaced by the warmer air at the bottom. At one side of the hox is a by-pass which opens into the box at top and bottom. As the warm air ascends through the by-pass the cold air is displaced and descends through the main chamber.

DOOR HOLDER (Fig. 7)—One of the less features about this door holder is its simplicity. It consists simply of a plate pivoted to the door and controlled by a tension spring. One end of the plate is provided with a floor-engaging surface, while the other is formed into a prong that projects nearly at right angles to the door. The relation of the spring and pivot is such that when the holder is changed from one position to the other, the spring swings past the pivot and holds the plate in the new position. The prong is designed to engage the spring and prevent the upper end of the plate from being pulled against the floor when the holder is released.

UNDERTOW INDICATOR (Fig. 8)—In this apparatus, which is evidently intended for use at halling benches, a goog is set ringing when an undertow is running. A submerged place is set out from the shore for enough to be affected by the undertow. This place is ordinarily held upright by a spring. When it is deflected outward it actuates mechanical and electrical connections that set the gong to ringing.

FENCE POST (Fig. 9)—This post is made of steel and is subular in form. The prougs at the bottom are for the purpose of anchoring it securely to the ground.

MUZZLE SUPPORT FOR GUN (Fig. 10; American patent to Frenchmen)—This is a plan for using the bayonet scabbard for supporting the muzzle of the gun. For this purpose a leg is pivoted to the scabbard, and a leg and curved link are provided for attaching the scabbard to the gun barrel.

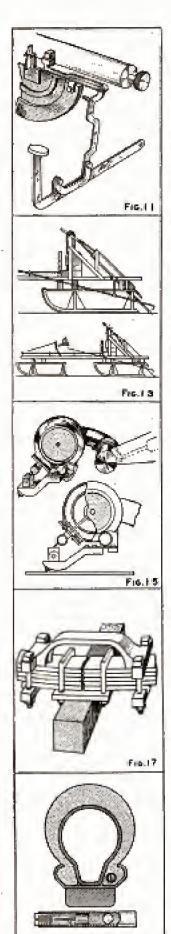

Fig. | 9

ERASING ATTACHMENT FOR TYPE-WRITER (Fig. 11)—With this attachment the eraser is permanently mounted on the typewriter and is operated by a key in an ap-and-down direction. The eraser is carried on the end of a pivoted arm which is worked through a lever-and-link mechanism by a key lever mounted on the side of the typewriter.

SANITARY BREAD BOARD (Fig. 12)—The purpose of this invention is to provide a fresh surface of paper each time bread is kneaded. The paper is carried in a roll at the end of the board, where there is also means for clamping and tearing the paper. At the opposite end are clamps for holding the paper in place over the board,

MOTOR-DRIVEN SLED (Fig. 13; American patent to a German)—The feature of this invention is the plunger rods, having pointed ends for engaging the snow or ice, which are alternately thrust downward and rearward. These rods are operated by a crank shaft, which in turn is driven by the motor.

SILO WITH HINGED ROOP (Fig. 14)—The roof is hemispherical in form and consists of two sections carried on shafts that project from opposite sides of the side, as shown. One section fits inside the other, so that a tight roof is provided when the sections are closed. When the sections are swung back and downward, unobstructed access to the interior of the side is provided.

ATTACHMENT FOR PHONOGRAPH (Fig. 13)—In this attachment the jewel point that works in the groove of the record is mounted on a fexible arm, an arrangement designed to prevent wear on the record. By adjusting the counterweight carried at the opposite end of the attachment the pressure of the point on the record may be varied, with a corresponding variation in the intensity of the tone.

EXTENSIBLE SUITCASE (Fig. 16)—The bottom is hinged to both of the sides instead of being rigid, as is the usual practice. With this acrangement the suitcase lies flat when opened.

REPAIR ATTACHMENT FOR VEHICLE SPRINGS (Fig. 17)—This device consists of a rigid plate that can easily be secured to the spring to bridge the crack or break. It is fixed in place by means of bolts that extend down each side of the spring, as shown, and engage clamping places placed under the spring.

BLOWGUN WITH AMMUNITION MAGAZINE (Fig. 18)—The blowgun is of an ordinary type and is equipped with a magazine, which is mounted on top of the barrel so that it can easily be slid back and forth. The harrel forms the bottom of the magazine. In the barrel is an opening just large enough to admit one of the projectiles, and a fresh charge is fed into the gun simply by sliding the magazine forward over this opening.

DEVICE POR CHECKING MILEAGE OF AUTOMOBILE TIRES (Fig. 10)—This device has recently been invented for enabling a manufacturer to determine whether or not a life has lived up to its guarantee. It consists of a metal tube which is imbredded in the beast when the tire is made. One end of the tube is closed, while the other is threaded to re cive a gutta-percha plug. Inside the tube is a weight equipped with a pointed shank projecting toward the plug, while in the end opposite the plug is a metal ball. At each revolution of the wheel the ball first falls against the end of the tube and then against the weight, driving the pointed shank a slight distance into the plug. The mileage that the tire has traveled can be determined by the distance the point has penetrated into the plug.

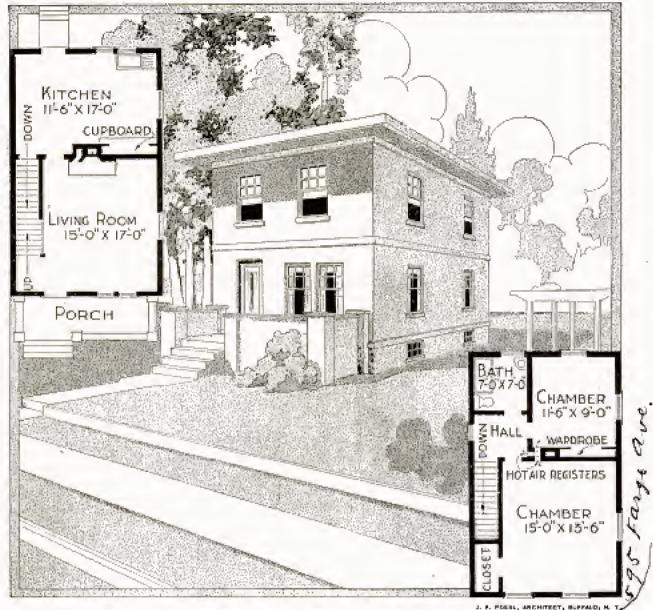

LEMON SQUEEZER (Fig. 20)—The interesting feature of this device is the operation of the perforated hinged bottom. While the lemon is being squeezed, this hottom is drawn up close, permitting only the juice to escape. With the handle drawn back, the bottom drops so that the peeling can be thrust out.

FOPULAR MECHANICS

CONCRETE RESIDENCE BUILT AT SMALL COST

DESIGNED originally as a cheaply built residence for workmen in the mining districts of Pennsylvania, this house is adapted as well to the needs of any owner of small means, especially for a suburban location, who desires to build a small home of permanent construction. The house is of poured concrete, a simple and quick method of construction, and is estimated to cost \$1,400. The exterior is what is known as "rough cast." In the interior, the walls and ceilings are of plaster laid on metal lath, the lath being so applied as to leave an air space for insulation against heat, cold, and moisture. The house is equipped with modern conveniences, and in spite of its small floor plan, the arrangement is convenient and the rooms are of sufficient size for comfort. An interesting feature that is made possible by the room arrangement is the heating system, there being only one hot-air duct. This is cast in the chimney and is provided with a register for each of the rooms except the bathroom, which must be heated from the hall. Built into the chimney at the side of the register in the living room is a fireplace. The kitchen is provided with a cupboard of ample size, while one of the bedrooms has a large closet and the other a built-in wardrobe. The front porch and steps, like the remainder of the house, are built of concrete.

Business is booming!

Dayton, Ohio.

Merchants everywhere tell our 800 salesmen that business is booming.

Farmers have had two record crops, at big prices, with big demand at home and abroad.

Stocks of manufactured material are short, and labor is in great demand.

Exports largely exceed imports.

Factories are busy, many working overtime.

More freight cars are needed, and steamers are taxed to capacity.

People are living better, and spending their money more freely.

This country has the best money in the world, and more of it than ever before.

Such a combination of favorable circumstances never has occurred before, and probably will never occur again.

Billions of dollars are passing over the merchants' counters.

The people who spend this money want the best service.

They demand it in all kinds of stores, from the smallest to the largest.

They get it in stores which use our up-to-date Cash Registers, which quicken service, stop mistakes, satisfy customers, and increase profits.

Over a million merchants have proved our Cash Registers to be a business necessity.

BEAUTY, SERVICE and ECONOMY IN THIS GARAGE

HAVE you ever seen a private garage in which were combined harmoniously the features of Beauty, Service and Economy? Here is one.

IT HAS *BEAUTY*, because it fits into the surroundings—it is a part of the home premises; because it has the graceful lines and "Homey" appearance that only a wood structure can have.

IT GIVES SERVICE, because, built of wood, it is drier and warmer in wet, cold weather than any metal, concrete, or brick structure possibly can be; and because the wood used—

Southern Yellow Pine

"The Wood of Service"

is the strongest, toughest and most durable wood adapted to such use — good for a lifetime.

IT IS ECONOMICAL, because a thoroughly satisfactory wood garage costs less than a similar structure—inferior for the purpose—of metal, concrete or brick; and because SOUTHERN YELLOW PINE, the best wood for such use, costs less than any other wood of anything like its high quality.

BUILD FOR SERVICE AND ECONOMY WITH SOUTHERN YELLOW PINE, and at the same time embellish, instead of disfigure, your home grounds.

We have the architect's working plans, lumber bill and cost estimate for this garage. They will be sent you FREE for the asking. Fill out and mail the coupon TODAY.

WHEE-E-E-E! A RIOT OF FUN FOR EVERYONE!

Whee-e-e-! Father makes a 200 yard drive. Billy's next. Shocks! The ball's ditched. Watch Mother. Good for her! She "lofts" out of the sand on to the green. Poor Clara! She "slices" into the water. Hear them laugh!

That's the way it goes—real golf! Talk about fun - say, one hour on the card-table links with this game will crowd more merriment into sixty minutes than you've had in a coon's age.

What if you've never played golf! What if you don't know a mashie from a mutton-chop. Here's where you pick up the whole thing in one game right in your parlor in the king of indoor sports "GOLF BUG!"

Note the youthful ring that comes back into Mother's voice when she plays it. And Fatherwhat a kid it makes of him. And the young folks they go wild about it. Some game, you'll articulate.

The GAME That's Biting 'em All!

The only game of golf with cards. You can slice, pull, top or foozle the ball; you can drive for 200 yards, or make a nice mashie onto the green and hole out in bogey. You meet all the conditions experienced on an actual course.

Start A Golf Club!

"GOLF BUG" clubs are all the rage. They are being organized for the winter

everywhere. Be the one in your set to start the "GOLF BUG" parties rolling. Novel way to entertain. Solves the Winter evening question of "what to do." Try a Golf Tournament instead of a Euchre or Bridge Party and see which makes the bigger hit. Don't fail to have the game for your next gathering.

Not any more a matter of luck than the field game. "GOLF BUG" is a scientific game of absorbing interest to both those who play golf and those who don't. Keeps you "on edge" from start to finish. One game will make , an afan. It's the game that's "got" us!

Eight golf sticks of 120 cards of highest quality; a golf links chart; book of golf terms and rules; score cards and markers whole outfit packed in handsome durable box for only \$1. Makes a crackerjack Xmas gift.

Ask for it at the stationers, sporting goods house or department store. If your dealer is not as yet supplied, send direct to us. Enclose only \$1.

Get the "GOLF BUG"

You'll avow that a dollar never did you a better turn than the one that buys your "GOLF BUG" game. The more you play the game the more you'll prize your investment. If your dealer hasn't got his supply as yet, just pin a dollar hill to the coupon or a letter and send it direct to us. If you don't say it's the most fascinating card game you ever played, return it and get your money back.

The game will be sent prepaid. Flease give dealer's name when sending to us. Today is the day to get the "GOLF BUG."

The Next Great Business

Domestic-Electric-Refrigerator

THE better living American public has been waiting to pass up the ice man and delivered ice. Are you the man who will control this demand in your territory? We will turn over an **exclusive** and **perpetual** sales contract to the financially responsible man who knows the present and future possibility of practical and economical electric refrigeration for the homes.

Not a laboratory experiment but a machine with two summers' proof of service behind it. Not a model but a manufactured product of interchangeable parts.

A silent, sturdy, electrically driven apparatus that keeps your present refrigerator at a uniformly low temperature night and day, without any attention or regulation.

Makes ice in cubes for table use from your favorite drinking water.

Maintains the safe and sanitary low temperatures insisted upon by the health experts—temperatures and dryness impossible with ice.

And the first new use of electric current that is cheaper than the service it supplants.

Don't write us if you are looking for a job, but if you want the most profitable business in your locality and have the ability or capital to finance a real monopoly, write for our proposition.

We have nothing to sell but machines and we have opportunity for the man who knows he can place domestic electric refrigeration in the good homes of your territory.

7 CENTS A DAY **Buys This Standard Visible** liver Typewriter

Much Less than Half Price FREE Trial - 10-Year Guarantee

This is the best typewriter offer ever made. typewriter is the genuine model No. 5 Standard Visible Oliver with complete, brand-new equipment. Perfect machines only. Not shop worn, not damaged, not inferior. Back spacer and tabulator - no features Warranted to be the equal in quality of any other \$100 typewriter.

This offer is not on some ancient style of blind typewriter, but on an up-to-date, standard, visible machine, the same kind of typewriter that many thousands of the world's best business firms are today using,

liver Points:

Nearly one-half million Olivers have been sold. Its record has never been equaled. It is easily "The Favorite."

Its simple efficiency, lightness and durability place it in a class ahead of all others; writing always in sight; writes in many different colors without changing the ribbon. Has the universal keyboard, back spacer, tabulator, ruling device, disappearing indicator. The type is beautiful; it is so hard that nothing can mar it. ontwears type found on other machines.

It is the lightest of all the standard typewriters. It is the only practical, portable typewriter. It has the lightest key action. Its speed is unlimited. It has the patented "U" shaped type bar which insures perfect alignment of the letters. One can write on ruled lines with it or it can be used to draw lines. It makes an efficient billing machine as well as correspondence machine.

The downward stroke of the type bar gives greater power. The Oliver is nearly always chosen for manifolding - some firms write as many as 20 copies at one writing. It does any practical thing which any typewriter can do.

It has the fewest parts. It requires the least adjustments. There is nothing to wear out. We guarantee it for 10 years.

While it is the choice of the experts, it is so simple in its design that anyone can learn to write on it in 10 minutes' time.

Sensational Keduction

Many thousands of purchasers paid \$100.00 for type-writers of this model. They were satisfied that at that price they were getting the best value that the market afforded.

Now, without any reduction in quality and with brand new standard equipment, our price to you is but \$39.80
—a saving of over half, and we give you over a year in

Our Offer Is This

Send the coupon and we will forward one of these typewriters with complete equipment on ten days' trial. We will ship it by express. When it arrives you leave \$3.80 with the express agent to be held while you try the typewriter.

If you do not find it to be the best typewriter that you ever examined, satisfactory in every respect, the best value offered anywhere, then you simply return it to the express agent, who will give you back the \$3.80 and return the typewriter to us at our expense.

If you decide to keep it, the express agent will forward the \$3.80 to us and it will be deducted from the \$29.80 price, leaving a balance of \$36.00, which you can pay at the rate of \$2.00 per month, the first monthly payment not being due until one month after date of delivery.

There are no interest charges, no red tape, no sales-men, no collectors, no bother. The simple coupon is all we теашіге.

Send the coupon today. Make sure of getting this bar-gain, as we will only supply 100 typewriters at this price.

Grow Grapefruit and Oranges in Florida

City Away From

Live a real life in the bright health-giving sunshine. Enjoy your work in the open air the year 'round, in America's most delightful—most charming of all states. A few conts a day will pay for your land—also trees any time you want them—which opens the way to your independence and can be made to soon bring you a life income. No better land or location for fruit, truck, positry and livestock can be found anywhere.

INVEST NOW IN OUR NEW LITHIA TRACT SUBURBAN TO TAMPA, the metropolic of South Florida. It is one of the few choice suburban farm tracts left in Hillsboro County, the recognized center of Florida's grapefruit and orange belt.

This is the third great Hillshore County tract that has been opened to homes where and invisions by our old established, responsible, thereoughly experienced organization. Over 2,500 families are now rejoicing because they bought at opening prices in our two former tracts. Every family on hely out they got a square and concross deal. Our new Lithia Tract new offers you the same wonderful openument on all sides within the past five years.

The visible supply of select Hillshore County grape truit bend is medium, away very fast. Properties bonds are existored around the Lithia Tract.—grapefrait and crange groves, truck gardene and positive farms one development on all sides within the past five years.

The visible supply of select Hillshore County grape truit lend is medium; away very fast. Properties bonds are existored around the Lithia Tract.—grapefrait and crange truit for a truck gardene and positive farms one development on all sides. Already buyers are building homes on our age. Lithia Tract, and raises no due to the exist.

Free —Absolutely Free — 100 grapefrait and crange tracts to each and every purchaser who reserves one of these farms. Sow. These traces will be held in our Norrestee until you are ready to plant them. This will give you a splendid start in developing a grave which will bring you an ever increasing income and greatly increase the value of your extire farm.

The C. E. Thomas Norrestee are growing the finest varieties of grapefruit, erange, lime, tancy peach, plum and other semi-tropical and southern fruit trees, which we are salling to land owners throughout the want, as which were calling to land owners throughout the scatt, as which were alling to land owners throughout the scatt, as which were the first trees grow's than the C. E. Thomas Norrestee Wagranted Citrus Fruit trees. Every tree fully guaranteed to grow.

P. Engines of super quality and worth every cent asked for them. Send for catalog.

Electric Light For Your Home

Have Electricity in your home this winter

No matter if you do live in the country or in a small town where direct city current is not obtainable, you can now have electric light and power in your home—at lower cost than ever before.

Think of having any room in your house instantly lighted at a snap of the switch. Think of the long winter evenings made bright as day by a steady, clear, non-flickering light.

The Uni-Lectric Lighting, Cooking and Power System

This wonderful invention, backed by a year's success in the hands of owners, is based on the fundamental principle of proper efficiency with utmost simplicity. Unlike all other private electric plants, the "Uni-Lectric" has no batteries, switchboards, the ostats, belts or chains. It consists simply of a high speed gasoline motor, generator and automatic governor, all complete in one small compact unit, occupying about two square feet of floor space. A complete "central station" plant in domestic, size—easily operated and requiring no electrical knowledge at all. Better still, its first cost is much less than that of any other system, its operating cost still lower.

Generates standard 110 medi éfrect cuarent und rons from one to 50 lights of different signs and standard makes. Also operates electric motor, électric iron, vacuum eleaner, fores putap, churn, washing machine, etc.

If you are still using knowene or acctylenc temps, it's high time you changed to "Uni-Lectric"—the only light that does not engage the copyen you ought to healthe. City people have been enjoying electric light and power for years—why shouldn't you have it this winter?

Write today for complete description, and let us demonstrate less how there is will oss to have your home electrically lighted this wholen.

Waterman Motor Company

182 Mt. Elliott Avenue DETROIT, MICH.

for Your Town Write quick for our remarkable proposition to DEALERS.

greatest sensation ever sprung in the typewriter trade—the great new high-grade REX—the first perfect, faultless typewriter ever produced.

"Re-built" Dealers

Think of the advantages of selling the high-grade REX and building up for yourself a permanent, profitable besiness with the sail of our big organization—more sales and larger profits! Why not sell a new, guaranteed, restoration-gring machine and avoid the kicks of disappointed, "rebuilt" entoners and the relinous competition of "re-built" sellers. Get our proposition.

The New Typewriter trade—the great new nigh-grade REA—the first perfect,

The New Typewriter Sensation

This is the new wonder that has staggered the typewriter industry and brought upon us a half of criticism from our compatitors for breaking the fixed \$100 price for standard machines. Here is the chance you have writed for, Mr. Dealer—an opportunity to line up with the livest typewriter organization in the world today. We are making the DEALER the foundation of our big insistes. We do not have, and will not have, any branch offices or salesrooms. By cutting out all the enormous expenses of branch offices and stores, reak, manager's and salesmon's salaries and commissions, etc., and selling only through deaders, we are able to marked a better typewriter—right from our factory to you—at an astounding low price. At last the typewriter field is open to you. Send coupon, We guarantee the REX for 10 years and prove it to be superior to any other \$100.00 typewriter made, with every casendal feature. Full sandard size; visible writing; lightest touch; unlimited speed; extra wide plasen; two-color ribbon; back speed; line lock; tabulator; removable platen; perfect paper feed, atc., etc. A masterplace of engineering skill—fe first printing.

Live Dealers Make Big Money we allow our dealers better profits than ablient are second-hand iso-called "rebuilt" typewriters, and protect them fully. If you are the first to answer that all from your town you can got the embalse appear for the new REX. Lon't wait, Write today for our daster's proposition and the HEX caselog. Dea't make this wonderful opportunity. Be the first to write us. No obligations whatevery is ending in product this toportunity. Be the first to write us.

Always Welcome - Riz La Croix

The man who rolls his favorite tobacco in Riz La Croix takes pride in the fact that he uses the best cigarette "papers" the world produces. And his cigarettes have the fresh, mellow flavor and the rich fragrance of the tobacco, without a particle of "paper" taste or odor.

RIZLA+

(Pronounced: REE-LAH-KROY)

FAMOUS CIGARETTE PAPERS

For a test—light two pieces of cigarette papers,
Riz La Croix and some ordinary brand.

Note how much more freely and evenly
Riz La Croix burns, with but a faint
trace of gray ash—no charring,
no odor.

It's far easier to roll your
own cigarettes in Riz La Croix,
because it's thin and light.
And being made from pure flax
linen, Riz La Croix is unusually

strong and perfectly adhesive.

Cigarette paper is so small an item of expense that every man can afford the best. Try Riz La Croix.

Wanted-Ideas Inventors! Send for these Remarkable FREE BOOKS, Today

Complete and full information about patents, everything the inventor or manufacturer should know, has been included in these Never before has such an inexhaustible fund of valuable information been at the inventor's disposal. Regardless of the fact that the compilation of this information cost us thousands of dollars, we will send to all interested persons, any or all of these books, entirely without charge or obligation.

"Millions In Patents"

This volume, 192 pages, tells the story of the remance of invention. The brain of the inventor is the magician that has made the ancient fairy tales come true. Millions have been paid for a hook, fortunes have come from a toy. Read "Millions in Patents," and you will realize that this country and all the nations of the world are ready to earith you beyond your wildest dreams if you can contribute one useful or amusing thing.

"What Is a Trademark?"

It is not an exaggeration to say that billions of deliars have been made out of trademarks, labels and copyrights. He who can fashion a trademark or design a label which will make a product stand out above all similar products, is indisputably a genius for whose brains the world offers almost unlimited money.

"Foreign Patents"

A good invention is bought not by one country but by the world. "Foreign Patents" shows you how the inventor may be paid by other countries and other peoples, as well as by this nation, for his ideas and his inventions. It explains how we, through our representatives in the capitals of the world, maintain for your benefit an endless chain of capertunities which, if you take advantage of them, will girdle the earth and make of your product an agent that may bring task to you take actions. back to you nich rewards.

"Inventions Needed"

This book, 256 pages, lays before you a description of the active and profitable field of invention. It tells you the inventions the world needs today, the devices manufacturers are seeking for their business, the ideas for which the public will pay hig money. It gives great men's ideas of the most important things needed in inventions now. Science is the key to wealth, and this key can be turned best by the inventor. This book tells you why.

How to Get Your Patent and Your Money"

The man who invents needs the co-operation of the man who invests. This book, 182 pages, is a guide to the inventor. It describes, according to the teachings of our experience and the lessons of men made rich by patents, how the inventor may secure money, the right amount of money, for the device which his health has constructed. If you have invented something and desire to learn what it will cost you to get your patent and what you must do to find your market, read this book.

Special Bulletin of Patent Buyers"

This bulletin, 64 pages, contains copies of hundreds of letters from wealthy men who are seeking to purchase patents. Next to the idea of the invention itself, the most valuable thing to the inventor is a hint of where there is a man ready to buy the inventom or to finance the inventor so that his device can be readily marketed. We set as intermediary, without one cent of charge, between the man who invents and the man who invests,

I give every detail of every case my closest personal attention and do not entrust your interests to assistants. Impartial advice on your ideas. I help you sell your patent. Terms moderate. My 90-page book tells what inventors should know before they apply for a patent.

GEORGE P. KIMMEL, Patent Lawyer Washington, D. C.

Agents! 500% Profit

\$25.00 to \$50.00 a week that's what our agents are making selling our new metallic sign letters for office windows, store windows and glass signs. For a quick, easy money making proposition for agents, salesmen and sign painters, there is nothing to equal the selling and putting up of our new metallic letters and numbers. There is no experience necessary to put up these signs. Anyone can succeed and make money right from the start. We will send you full particulars and you will see how easy it is to make money in this business. One agent says: "Have already put up 14 signs in this little burg and more in sight. Your letters are the best thing I have seen in years. Will soon be in a position to buy in 5000 lots." Another says: "I am getting all the work I can do and the letters have given entire satisfaction everywhere." We are daily receiving such letters from agents who have started in the sign letter business. This is the only field that is not overcrowded. There is a big demand for window and glass signs in every town. You can sell to nearby trade or travel from town to town all over the country as you please. We would be pleased to send you a free sample and full particulars. WRITE TODAY. ADDRESS

Manufacturers Calling for Over Two Hundred Inventions

Money Is Waiting to Back the Good Idea

(By a Washington Patent Attorney)

Never was there so good an opportunity for the inventor of something-unything-of merit as right now.

Manufacturers with money and facilities are asking for ideas-calling for them. The supply is not nearly equal to demand. Over 200 inventions are asked for in a list just given in a little book "What to Invent." The demand is not for anything extraordinary —just the common everyday things that make work easier or life more pleasant in the household, the shop or the

You might think the possibilities of the window screen had been exhausted, but I know of 28 concerns that are looking for a new screen, duly covered by patent, which they can manufacture. I know of 46 manufacturers and others who are ready to manufacture any good, patented household article such as can openers, baking pans, coffee pots, washing machines carpet sweepers and other devices.

Within the last few weeks I have received forty special requests for a dishwasher and drainer; seventeen others request an improvement in scissors. Manufacturers know that everyone must bave a pair of seissors in the house, and they realize that a novelty in them would always sell in place of the old kind, and hence the demand. Among my letters are sixteen requests for a device to turn sheet music on at music stand or piano, and seventeen people are interested in the

Invalid bed invented by a Wamari. А сатралу s immediately organized for its manufacture

purchase of a patent on a device for holding an electric light in any position. Besides these there are hundreds of manufacturers who do not specify any particular device but state that they would he interested in anything of merit

A Chicago man says: "I want something that can be sold to farmers by mail. There is practically no limit to the investment my associates would make in a good proposition." A man in Woodhaven, N.Y., says he is in the market for a small household article, light in weight, which van be sold somewhere around ten cents.

A prominent manufacturing company is interested in something to sell to hardware stores, but would also be interested in other things promising to be money-makers,

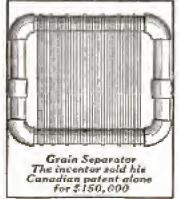

A man in Revere, Mass., says: "I am looking for something that can be manufactured, plant equipped, etc., and marketed for an outlay of not over twenty-five thousand dollars."

A big textile machinery company says they are interested in newly patented devices that can be

either bought outright or manufactured on royalty. They do not require machinery inventious alone, but anything of merit.

A company in Belvidere, Illinois, wants patents on small tools or metal novelties.

A Dayton, Ohio, concern writes for some machine or device that would have a general sale throughout the land.

The names and addresses of these prospective purchasers are supplied absolutely without charge by Messrs. Chandlee & Chandlee to those who obtain patents through their firm. This firm has been in practice before the Patent Office for over twenty years, and its members are, consequently, familiar with every detail of patent work. They also issue a booklet entitled "How to Obtain a Patent," which tells in simple words just how to go about protecting an invention. The two books, "What to Invent" and "How to Obtain a Patent," are both free. Why don't you write for them and learn what manufacturers are looking for and how to protect your ideas? If you have an invention, send a sketch or model and description of it to Chandlee & Chandlee, 969 F Street, Washington, D.C. They will give you a free opinion as to whether or not it can be putented.

and more as you get accustomed to the business. The certainty of success is about as sure as anything in this world can be. You let down the DRAW BRIDGE for-

SUCCESS to enter into your career by getting into business for you is the one where investment is small—the returns quick and yourself. The business for you is the one where investment is small—the returns quick and for cash—where the margin of profit is large—the demand for your PRODUCT or SERVICE constant and ever on the increase. Each year adds thousands of new Automobile Owners—they need YOU to keep their tires in service.

Put Yourself

He Is Making Money

HERE IS YOUR OPPORTUNITY!

You might just as well be the first to enter this paying business in your town—open your shop and let the money roll in. Every automobile sold means more tires to mend. You start with one machine. The business grows fast. You need another and then another. Soon it gets to be a regular business of adding machine—after—machine until the first thing you know you are running a big shop—you are operating in a big way—rou are a tend business man and a factor in your community.

You know that punctures and blow-outs are common—tires need retreating and valuanting every dar—sometines and valuanting every dar—something sold valuanting and the old ones fixed.

in general and the students' parents in particular in general and the students' parents in particular were enraged at this radical innovation, alleging that it was an unpardonable crime for men to enter the gate of a girls' school in broad daylight, even if they were teachers. The school authorities, therefore, ruled that the male teachers should veil their faces when they possed the gate of the school. It is an absord idea, but the students' parents were satisfied with it.

NEW 312-PAGE ELECTRICAL and WIRELESS CATALOG

More than ever justifies your verdict that it is the one catalog worth while

FOR THE BOY—HOME OR STORE

in stamps will bring this unrivalled catalog Only 8c to your home. The great cost of catalog

and the exceptionally low prices (often-times fully 25% below usual retail price) prohibits its distribu-tion otherwise. You may deduct the 8c on first dollar purchase.

Our records, which have been verified by a representative of this magazine, show that 70% of our catalogs produce us patrons. Many of our competitors admit the waste of 90% of their catalogs. Who pays for them? This is the big, controlling reason why you should have our catalog, backed by a great selling and purchasing power, before even thinking of buying elsewhere.

Over 40 New Pages of Wireless Instruments

and substantial reductions on many popular wireless instruments and standard electrical supplies.

A FEW OF THE ARTICLES IN OUR CATALOG:

129 up. Wireless Instruments (129 pages) magnet wire of all kinds, raw material, storage batteries; tolegraph instruments, batters motors, commercial meters and generators, sewing machine motors, telephones, step-down transformers, massage vibrators, bells, push batters, auto accessories, flash lights, hand lanterns, and ministrum lamps, Xmas trees outfile, voltmeters, madeless, highting plants, Victrolas, air ribes, electric acceptances, model builders, electric railways, electrical and mechanical books and general electrical supplies.

THE WILLIAM B. DUCK CO., 223-227 Superior St., TOLEDO, O.

WHY IS A SHIP CALLED "SHE"?—Nothing is found in the naval archives to show why a ship is always spoken of as "she." In German the word ship, "Schiff," is neuter gender. In French "vaisseau"—ship—is manerine and is never spoken of but as "le vaisseau." They are given tentiane names sometimes, however, says the Fleet Review, in reply to an inquiry. Calling a ship "she" must be set down to maintest and poets. No mention of a reason for the use of the term has been

Ice - Fire

These are the extremes which a spark plug must stand in winter. But you never give a thought to these things because your motor is equipped with

Dependable Spark Plugs

Our tremendous output—doubled this year as compared with last—enables us to go to extremes of engineering which lesser production would not warrant.

These extremes give you that dependable aid to ignition which Champions alone provide.

There is a Champion especially designed and constructed to meet the exact conditions imposed by your motor. Your dealer will tell you which one it is and supply your wants.

Be sure the name Champion is on the porcelain.

4 out of
American made
gasoline motors

are equipped with Champions. The men who build the big sellers — Ford, Overland, Studebaker, Maxwell and 85 others specify Champions.

Champion Priming Plugs MakeWinterStarting Easy

It is not enough simply to enrich your mixture with the dash adjustment, or even merely to prime your cylinders, if the day is really cold.

Prime your plugs.

Then you have your rich

Then you have your rich mixture right at the ignition point—right where the first spark can fire it.

All-in-One Champion is the pet-cock type.

It is made in various sizes to serve efficiently the various styles and types of motors.

The Champion Guarantee

All-in-One Champion \$1.25

TM

Complete satisfaction to the user — free repair, replacement or money back.

CHAMPION SPARK PLUG COMPANY
401 Avondale Avenue TOLEDO, OHIO

Get into a Paying Business

Here's an opportunity for a real hustler to start in business for himself. Or, it's a chance for some live motorcycle dealer to enlarge his present business.

The retail motorcycle business is a profitable line, and the local selling rights for the Harley-Davidson are generally hard to obtain. This is because they are valuable—ask any motorcycle dealer.

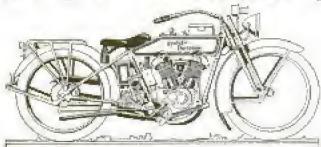

In a big city, widely known as a manufacturing center, and surrounded by rich farming territory, a dealer who has been conducting a profitable motorcycle business is compelled to sell out.

The conditions which compel this action have handicapped further expansion of his business, and now force him to dispose of his interests. Here's a real opportunity to secure a business which is paying a good profit, and which can be made even more profitable to a man who is not handicapped as this dealer has been.

Only limited capital is necessary, but anyone interested must demonstrate that he has enthusiasm, good business ability, and plenty of push and energy before we can go into the matter in detail.

Write for particulars. All correspondence strictly confidential.

Harley-Davidson Motor Company, 444 B St., Milwaukee, Wis.

In a selling organization the size of ours, composed as it is, of thousands of dealers, some dealers are satisfied with one-third the profit they might make.

Each year at the opening of the new season we are compelled to replace some of the inactive ones. A number of splendid opportunities are open for the right men.

Possibly we have not closed a contract for your town. Find out.

TRAPPERS WE BUY

THE TEMOO ELECTRIC MOTOR COMPANY 121 Sugar Street, LEIPSIC, OHIO

Make Added Profits by This Process

Manufacturers of metal furniture, tacks, window sash, automobile parts, steel tanks, boilers, machine tools, laundry equipment, surgical apparatus and many other products have simplified construction and increased efficiency and profit through oxy-acetylene welding.

In some lines it has entirely displaced the rivet, resulting in higher quality at less cost.

Oxy-Acetylene welding makes added profits possible for you, by providing the best, quickest and cheapest method of metal joining.

The oxy-acetylene process is not limited to production work. It often more than pays for all needed equipment in time saved on repairs by repairing a single piece of broken or worn equipment, preventing tie-ups in production, delays and expense of replacement.

Necessary equipment is not especiaive. We lurated high-grade apparatus for 500 (Canada 372); acceptance service of slight additional cost. Adaptable for any-negatives cutting with the addition of special certing appearage. Thereugh instructions are turnished free to every user of the Front-Chie Lite outh. We will main your operation for it you desire.

Employs Prest-O-Lite Dissolved Acetylene I mody-made carbide gas) in periode cylinders—backed by Prest-D-Lite Service. Used as convesionily as cylinders of caygen Saves large initial outlay and heavy depreciation of making crude acetylene is cabbide generators. Perfectivalised, deared and purified—makes before wolds and is cheaper to use.

A Profitable Business of Your Own

Enterprising men looking for new and highly profitable fields should investigate the wonderful opportunities in doing Oxy-Acetylone repair work for others.

The mady possible uses for Oxy-Acetylene welding in your shops today will as prize you. Write us for engineering data on any phase of welding work you are contemplating. Oxy-Acetylene literature, thoroughly illustrated, sent free.

Musical history was made a short time ago at Orange, New Jersey. At the laboratories of the New Edison Diamond Disc Phonograph, 300 phonograph experts were witnesses to an epoch-making experiment.

When the test was done, the entire gathering agreed as one — a modern miracle had been performed before their eyes!

Three factors predominated.

Alice Verlet, the famous Belgian prima donna, whom European musical critics have hailed as the "New Queen of Song." The New Edison Diamond Disc Phonograph.

And Thomas A. Edison. He alone knew of the revelation to come; of the human voice with all its range, its sweetness, its mellowness, its sympathy and pathos coming from the instrument he had created. Miss Verlet stood beside the New Edison Diamond Disc Phonograph. Mr. Edison sat with his head bowed upon his hand.

There came the clear notes of the beautiful song, "Caro Nome," from Rigoletto,

Which was singing, phonograph or lady? The ear could not distinguish. Only the eye could discern that Miss Verlet's lips were not moving. The Edison Diamond Disc was singing alone. Then—a greater volume—but only a greater volume—Miss Verlet joined her voice with the singing of the Edison Diamond Disc.

Two voices—exactly the same two—were singing together. No one among the 300 could tell which was the more clear or distinct, or more full of feeling.

The song volume decreased. The ear heard but one voice. The eye must tell again. Mins Verlet's lips were moving. It was she who was singing.

Faces were lit up with surprise—even with amazement—a modern miracle was happening just before them.

The phonograph and the lady continued their duet to the end. Enthusiasm, almost unbounded, ran through the audience.

Nearly 300 Phonograph Experts Held Spellbound By Unprecedented Re-creation of Music

Quickly these men realized that there had been given to the world a new instrument which years of endeavor had made so complete that even "perfect" failed as a descriptive word.

They could not describe the tone of the New Edison. It was not enough to call it "human, life-like, natural." No more could they describe a beautiful rose as "true to nature." This New Edison was nature itself. It was the artist in all but form.

The Edison has no tone of its own. It is a perfect vehicle for the re-creation of the artist's voice—or instrument.

New Edison

Diamond Disc Phonograph

No Needles to Change

The reasons for the absolute perfection of the Diamond Disc Phonograph are manifold. The music passes through a real diamond, traversing a record so hard that human hands cannot break it. Edison records have been played 6,000 times, with the same sweetness and fidelity from the last rendition as from the first. Edison records are thicker than any ever made before.

By Mr. Edison's vertical system of recording, used only by him (as against the lateral system),

Unbreakable Records

there can be no wear on the record. The recorder makes a polished path which the smooth surface of the diamond stylus merely floats over.

The smooth diamond point in passing over the record is as an automobile running over a hill and then into a valley. There is no more wear on the top of the hill than at the bottom of the valley. This is in contra-distinction to the lateral system of recording, which is as a twisting river always wearing away its banks.

Edison dealers everywhere are ready to give you a demonstration of the new Diamond Disc. Ask to see the \$250 Diamond Disc Phonograph, which is the official laboratory model.

Special Edison Christmas Concerts are being given everywhere by Edison Dealers. You will be under no obligation if you ask to have your favorite records played for you. Make up your mind to hear a Christmas Concert early. If you would prefer, arrangements can be made to have a demonstration in your own home.

Or, write us for a catalog of records and Diamond Disc Phonographs

Weavers of Speech

Upon the magic looms of the Bell System, tens of millions of telephone messages are daily woven into a marvelous fabric, representing the countless activities of a busy people.

Day and night, invisible hands shift the shuttles to and fro, weaving the thoughts of men and women into a pattern which, if it could be seen as a tapestry, would tell a dramatic story of our business and social life.

In its warp and woof would mingle success and failure, triumph and tragedy, joy and sorrow, sentiment and shop-talk, heart emotions and milliondollar deals.

The weavers are the 70,000 Bell operators. Out of sight of the subscribers,

these weavers of speech sit silently at the switchboards, swiftly and skillfully interlacing the cords which guide the human voice over the country in all directions.

Whether a man wants his neighbor in town, or some one in a far-away state; whether the calls come one or ten a minute, the work of the operators is ever the same—making direct, instant communication everywhere possible.

This is Bell Service. Not only is it necessary to provide the facilities for the weaving of speech, but these facilities must be vitalized with the skill and intelligence which, in the Bell System, have made Universal Service the privilege of the millions.
